Institut für Physik der Atmosphäre

Main question:

Where in the vertical column of the troposphere does particle formation (particles > 4 nm) occur?

Data:

Multi-channel Butanol-CPCs flown on the DLR Falcon aircraft
(in polar regions also on AWI Dornier-228)

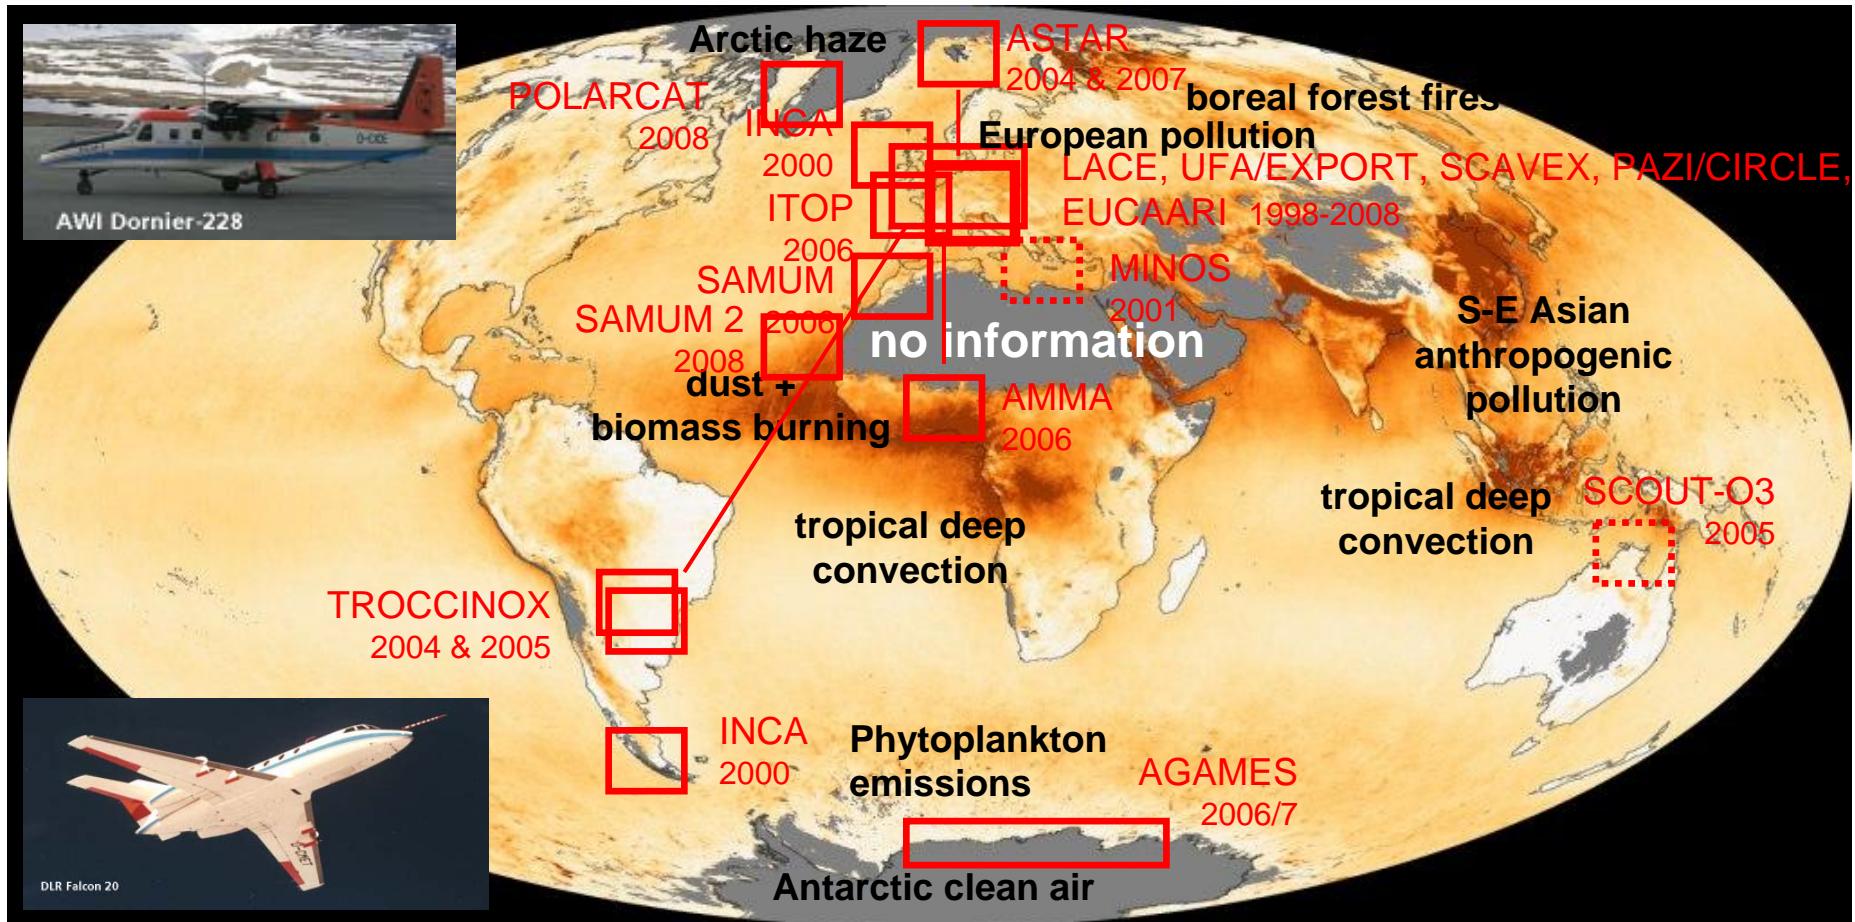

Information is available (only) from CPCs with cut-off
>4 and >10 nm (sometimes >5 and >14 nm)

This presentation:

Not much analysis, just a collection of observations made during various field campaigns (campaigns were in general all targeted at other objectives)

Aircraft field experiments with DLR aerosol measurements

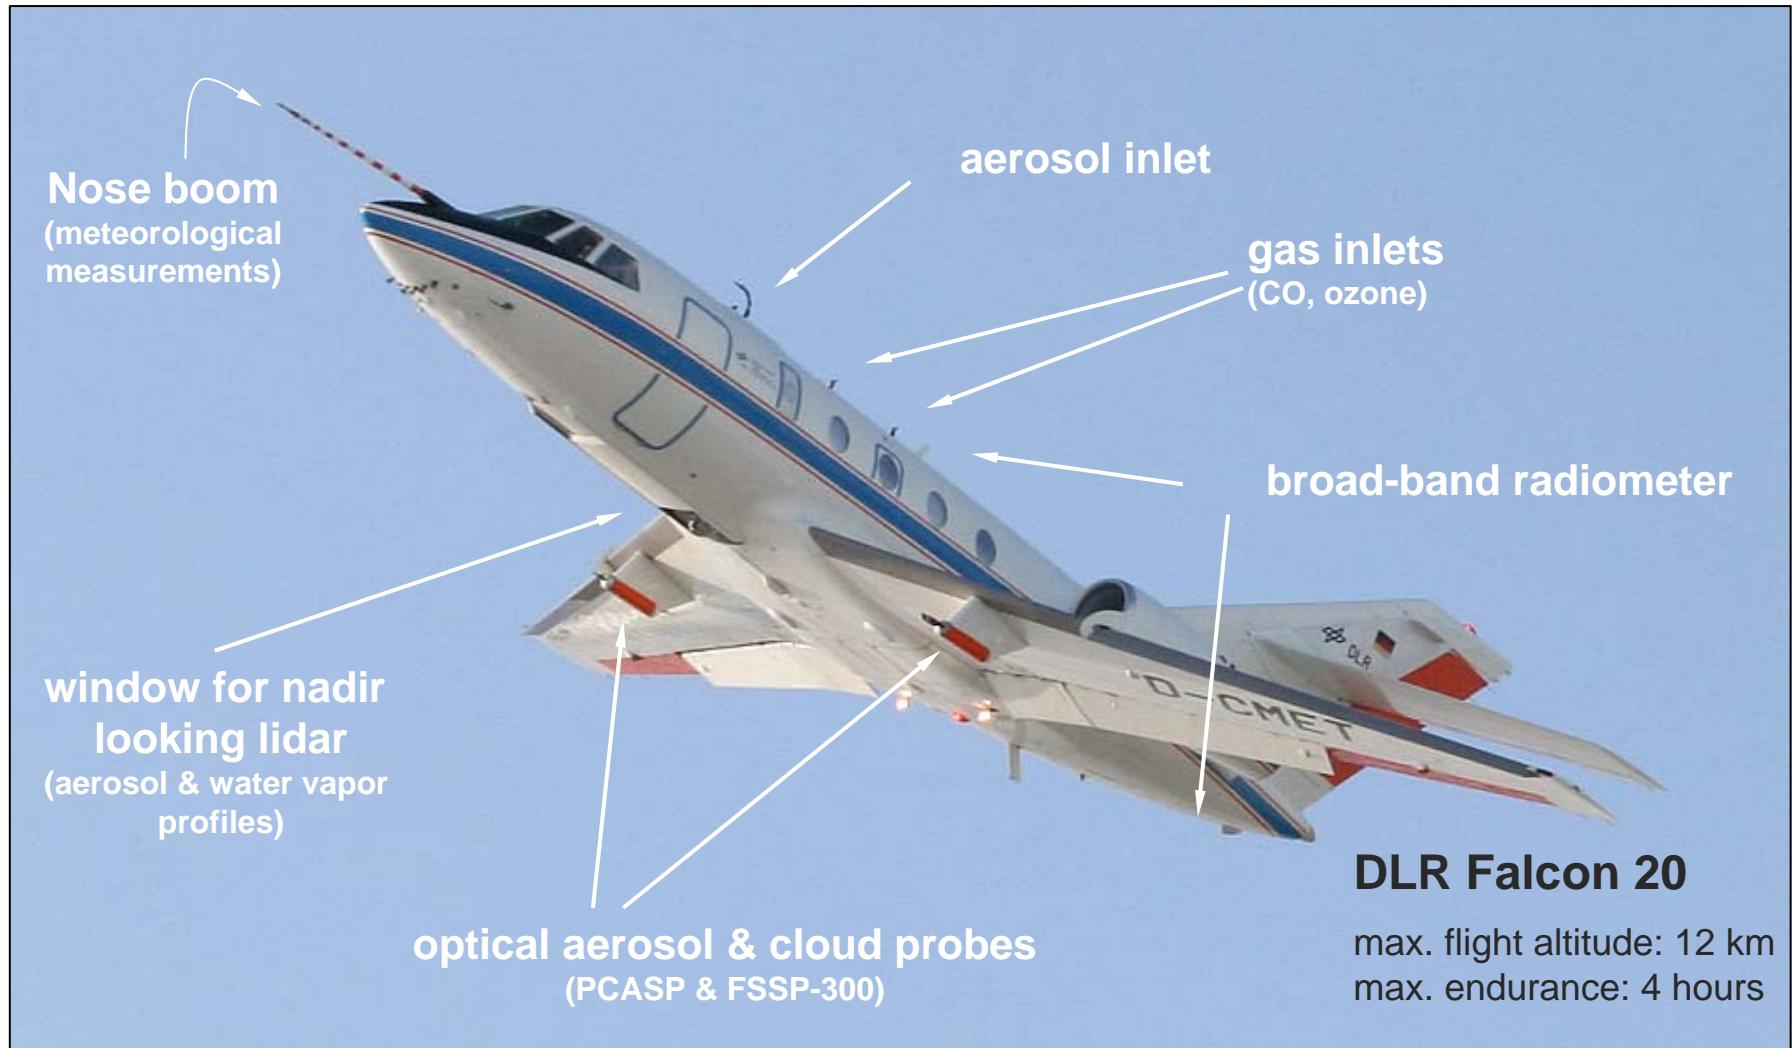

2006 annual average of MODIS AOT (@ 550 nm)

**Falcon measurements over the boreal forest
near Hyytiälä?**

Sorry, no. We only flew once over boreal forest and that was in Sweden (before and after refueling in Kiruna)

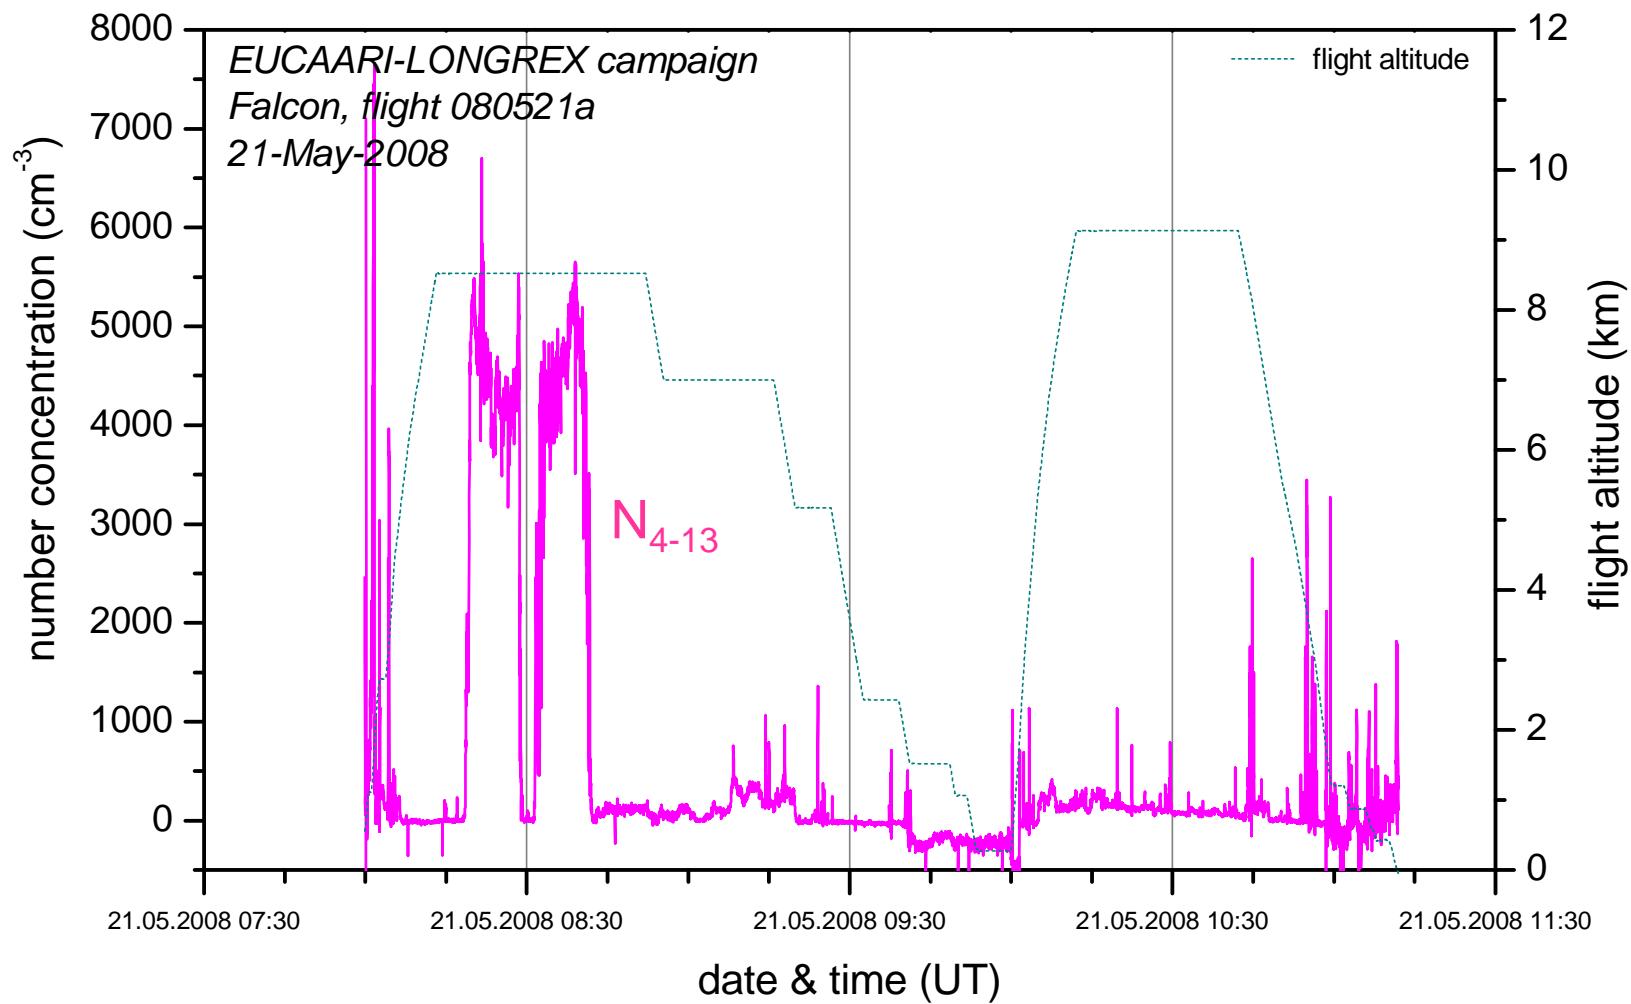

EUCAARI-LONGREX in May 2008

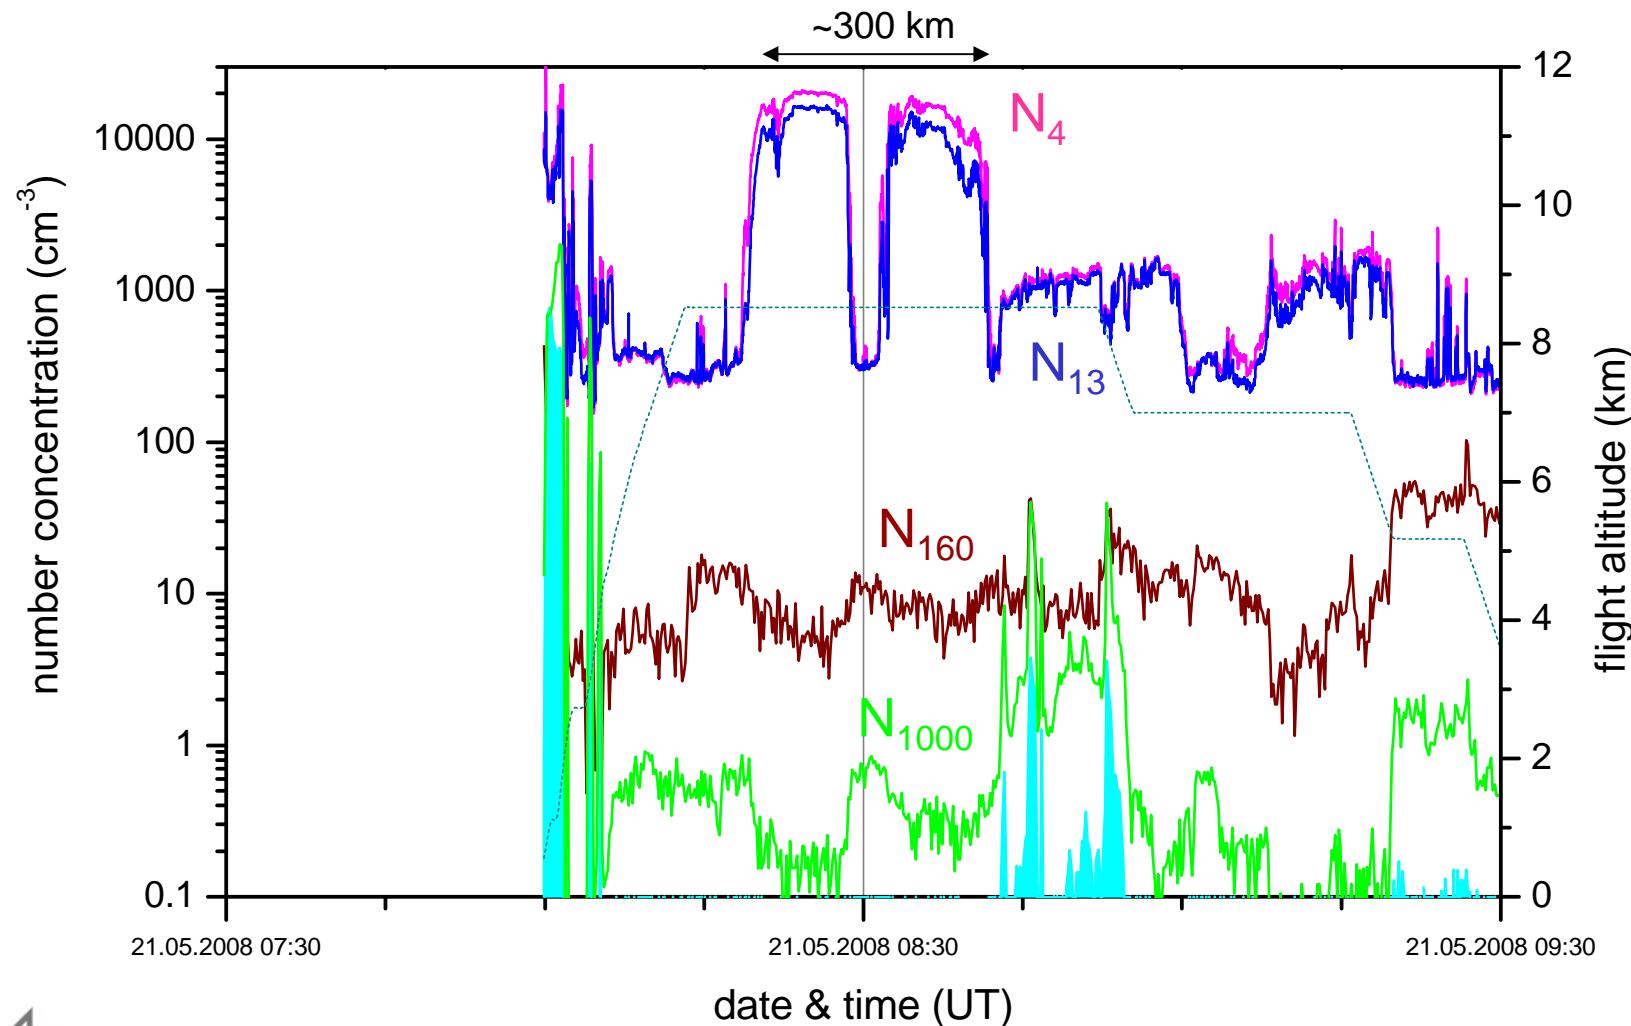

Observations over Central Europe

- DLR Falcon flight track
- Location for vertical profiling with Falcon
- EUSAAR ground stations
- Oberpfaffenhofen (operation base)

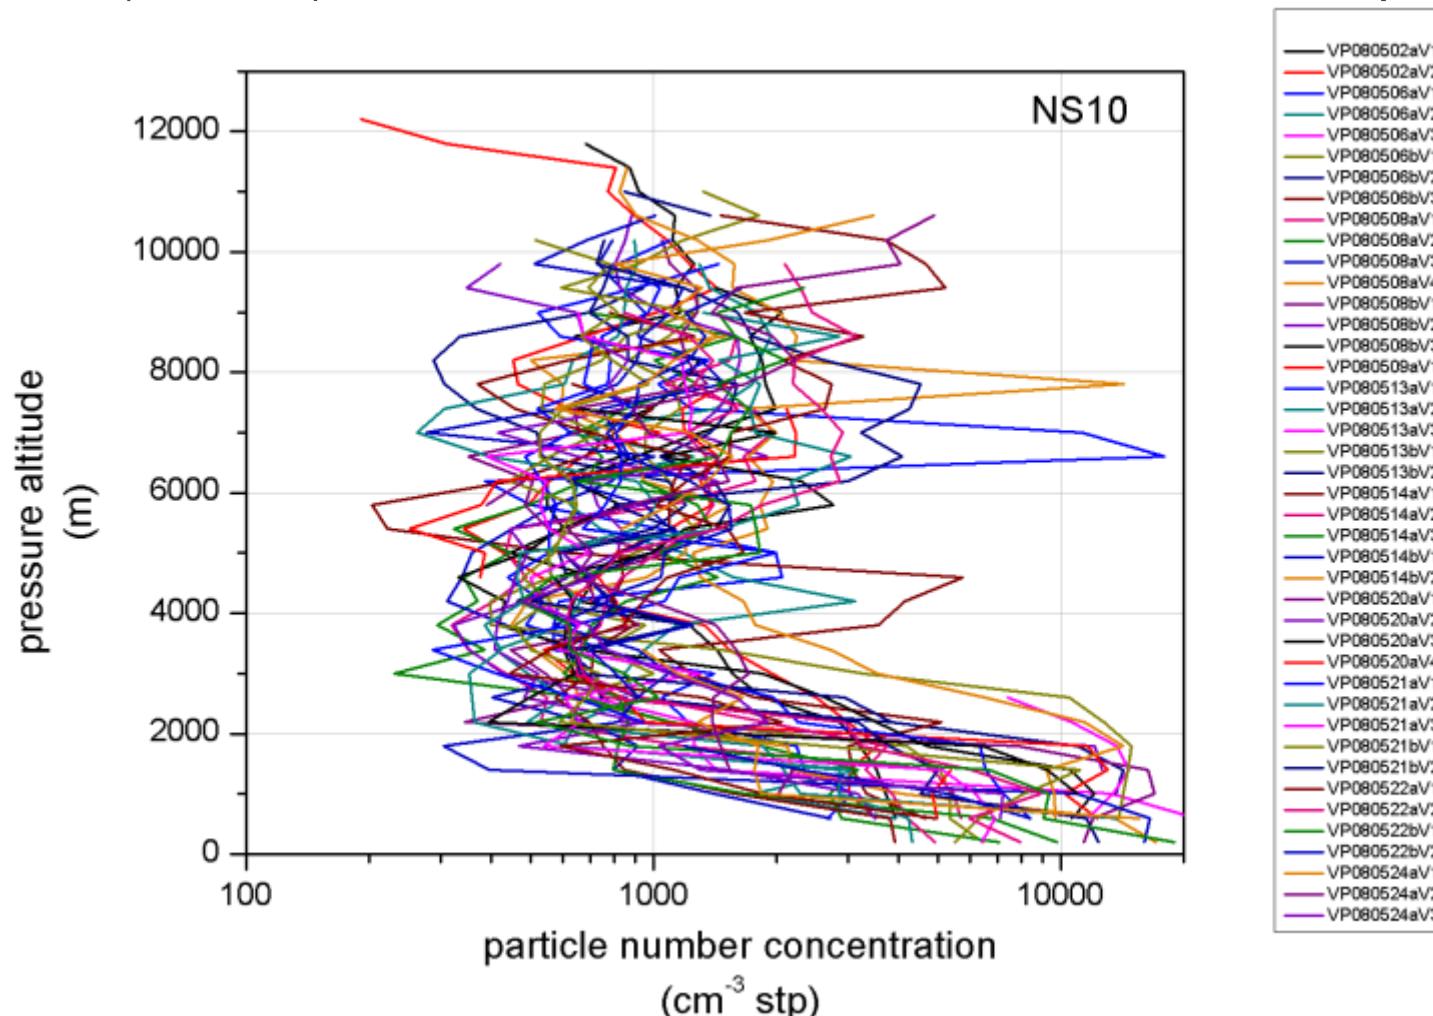

Particle formation event in the upper troposphere over Germany, May 21, 2008

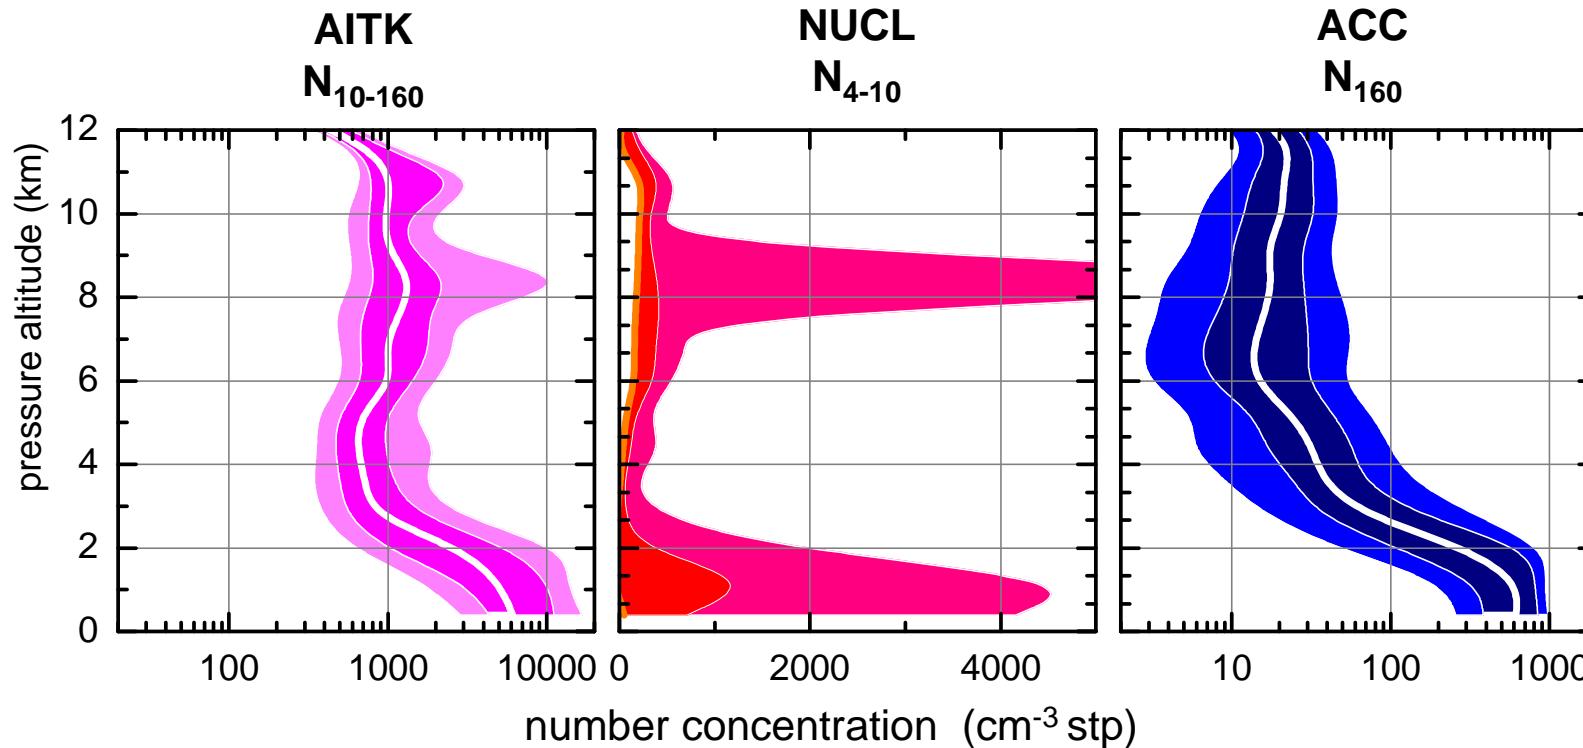

Variability in vertical aerosol distribution over Europe during May 2008

Total CN (>10 nm) number concentration for all Falcon vertical profiles

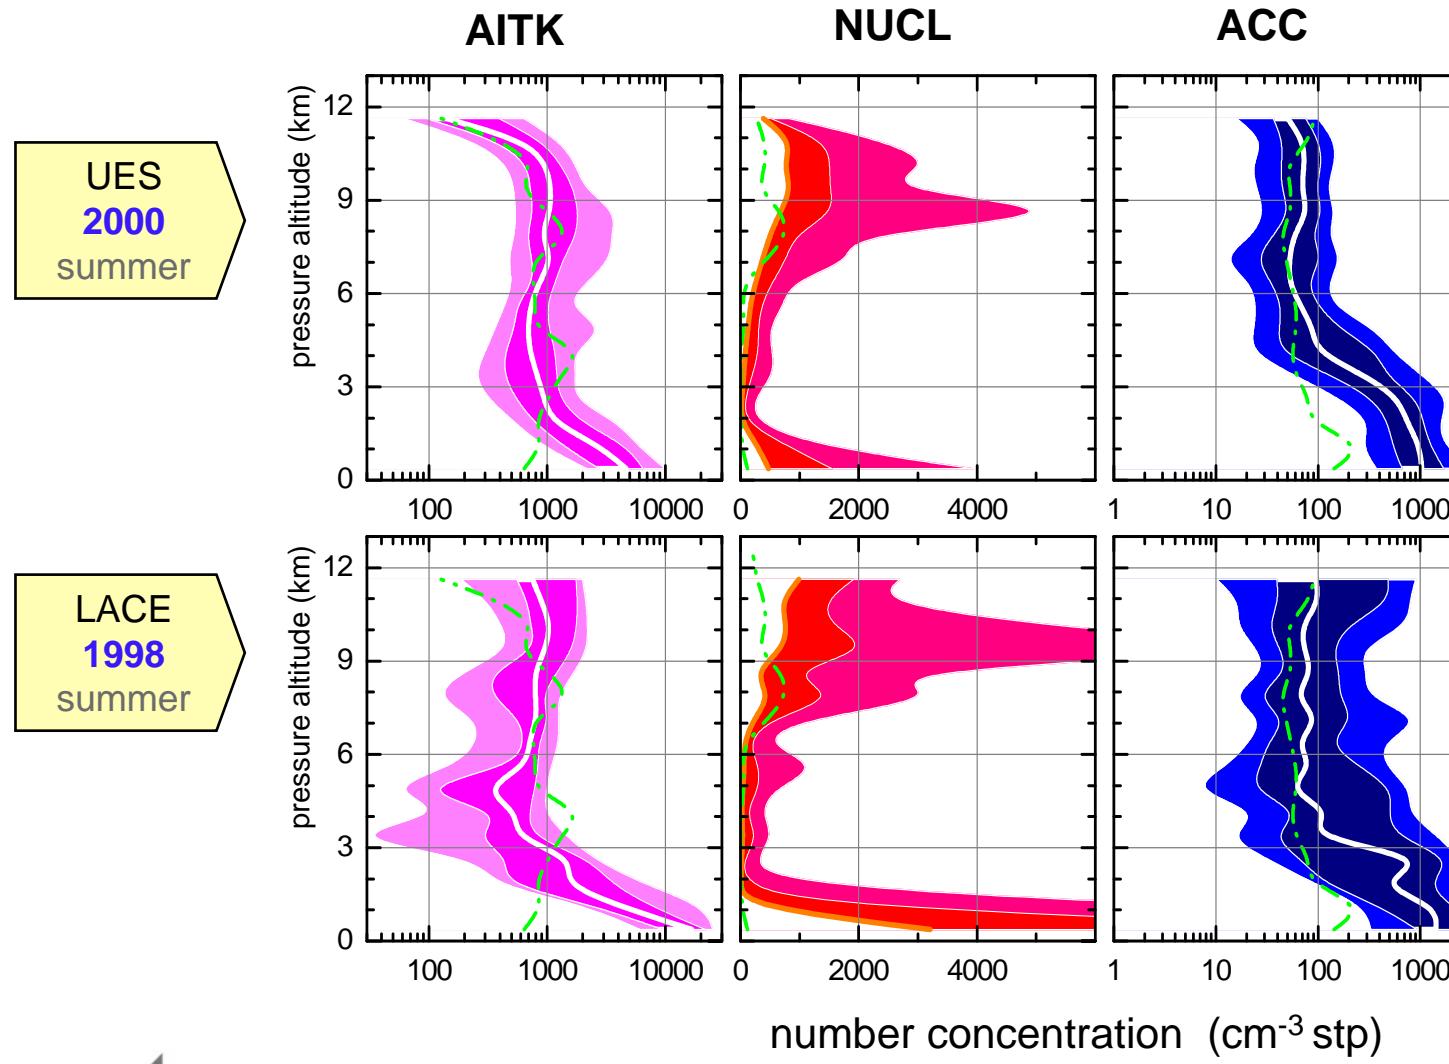

Median number concentration profiles & statistics (EUCAARI-LONGREX)

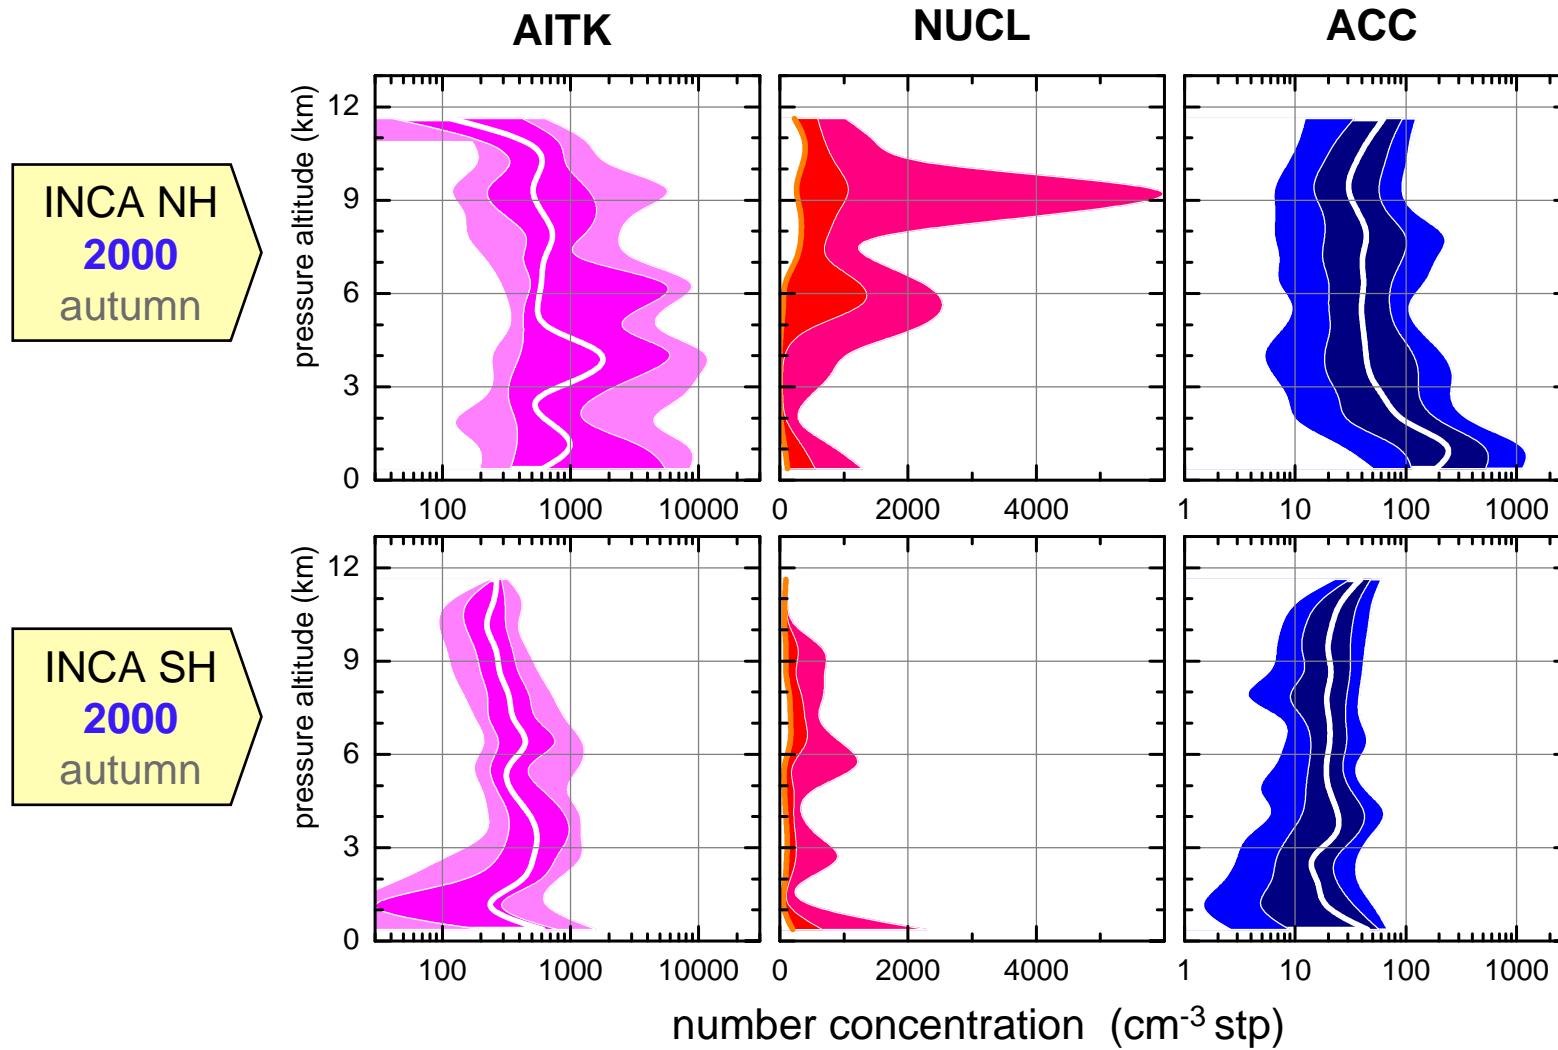

- Profiles: Median, 10-, 25-, 75-, 90-percentiles per 800 m height interval
- Logarithmic concentration scale (except NUCL),
concentrations corrected to standard conditions (stp)
- In-cloud data excluded from data set

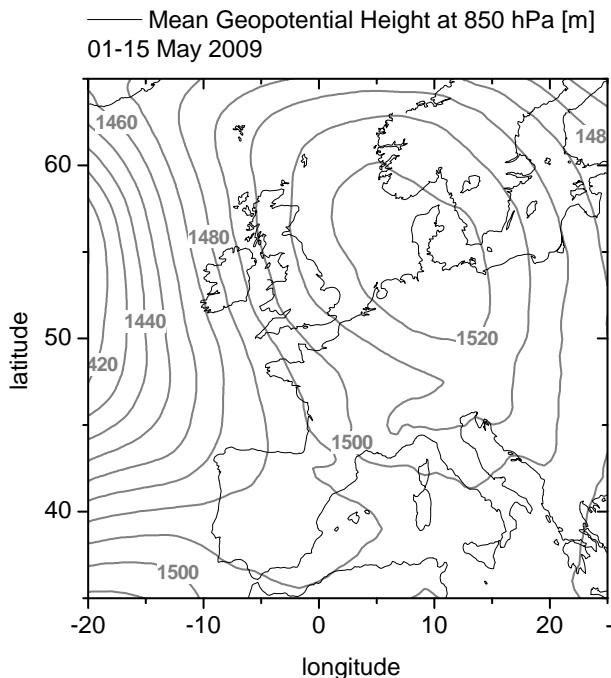

More mid-latitude aerosol vertical profiles over central Europe

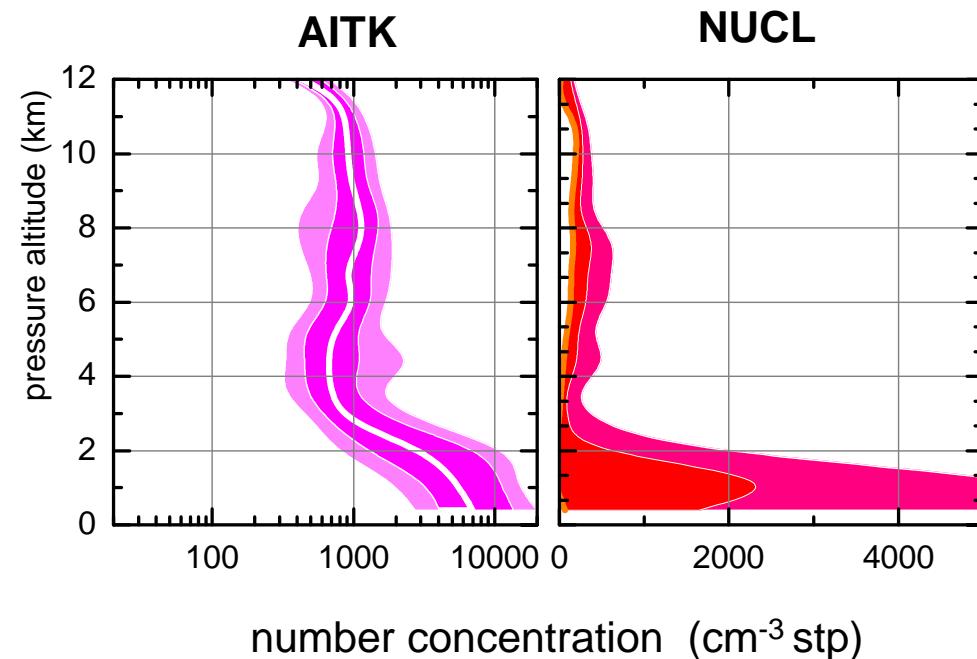

Mid-latitude autumn aerosol vertical profiles: southern & northern hemisphere (rather marine influence)

When does particle formation NOT occur in the free troposphere?

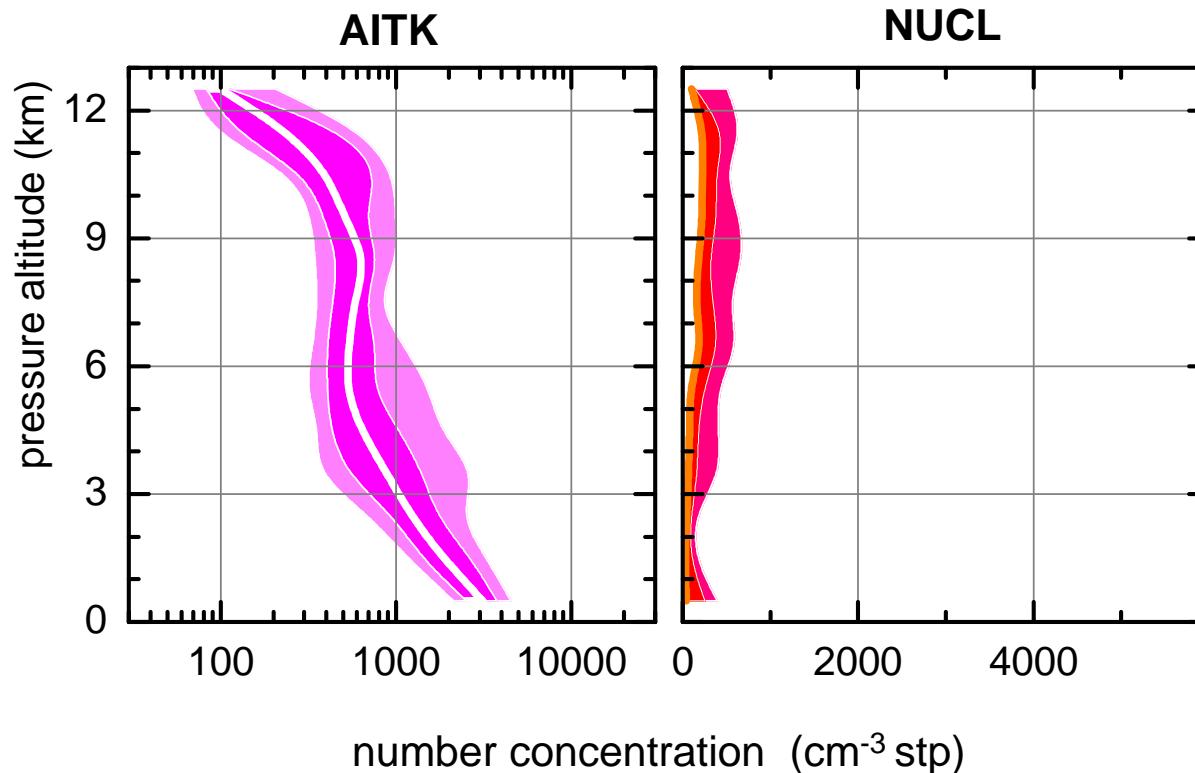

High pressure system in first half
of May 2008 → subsidence of air

Large-scale subsidence of air over the Mediterranean in summer

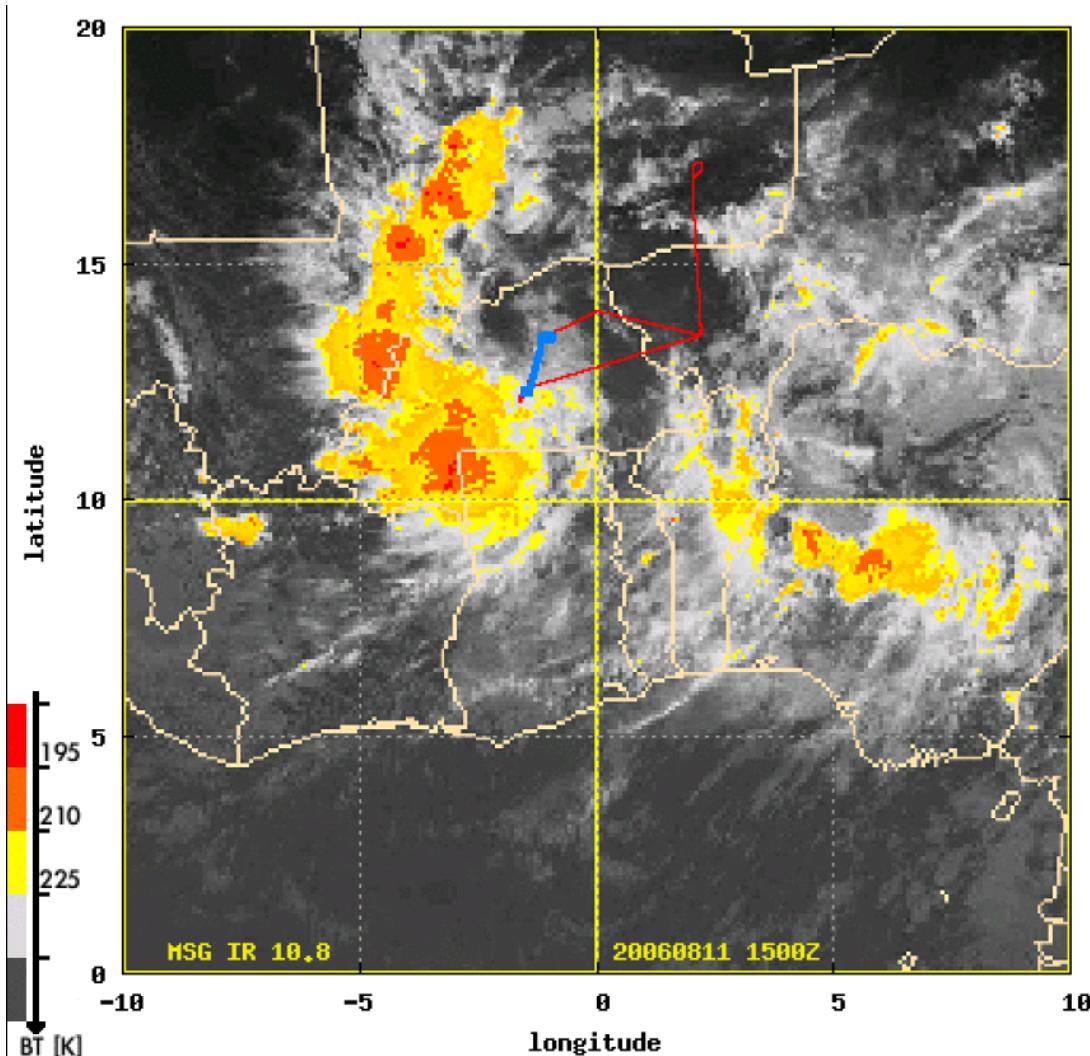

MINOS
east Mediterranean.

First airborne observations of sub-3 nm neutral atmospheric particles during EUCAARI-LONGREX with airborne NAIS

Mirme et al, ACP, 2010

Median concentration profiles total and charged clusters and particles + corresponding concentration ratios between total and charged cluster/particles

EUCAARI-LONGREX campaign, May 2008

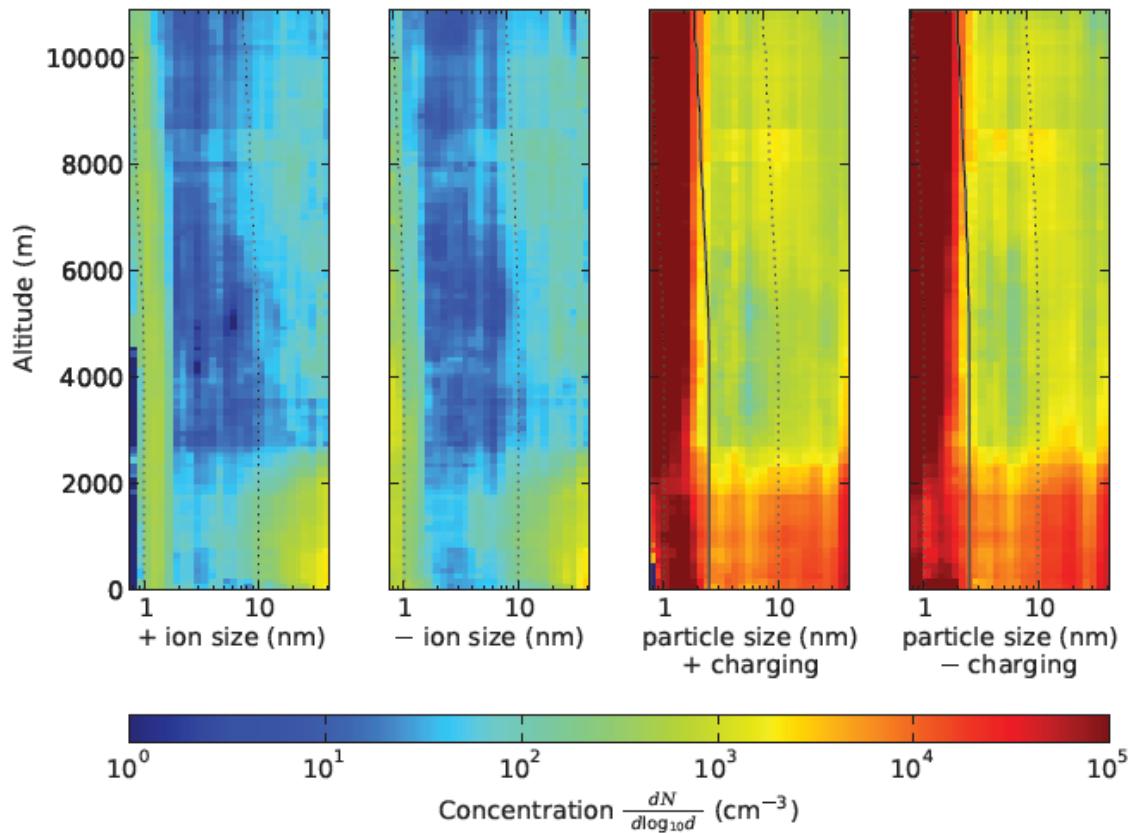

Conclusions of NAIS measurements with DLR Falcon aircraft

- ➔ first-time aircraft deployment of a NAIS instruments on the DLR Falcon during EUCAARI
- ➔ abundant presence of both neutral and charged sub-2 nm clusters at all altitude levels
- ➔ growth of particles into sizes >4 nm does happen only under certain conditions apparently
- ➔ no indication of an enhanced role of ion-induced nucleation toward the tropopause region

Atmospheric sub-3 nm particles at high altitudes

S. Mirme¹, A. Mirme¹, A. Minikin², A. Petzold², U. Hörrak¹, V.-M. Kerminen³, and M. Kulmala⁴

Summary

Particle formation observed from aircraft with CPCs (~4 nm lowest cut-off); during EUCAARI first time deployment of NAIS.

Particle formation events are observed in the troposphere in BL and UT, (almost) never in between. Occurrence is patchy; high variability of number concentrations. Atmospheric dynamics is important.

Aitken mode concentrations profiles in the FT are shaped by particle formation events.

In mid-latitudes UT properties are usually controlled by long-range transport. Particular origin of particle formation events often not clear.

In the tropics particle formation in the UT is connected to deep convective processes (either uplift of precursors or wet removal of pre-existing aerosol or both).

From aircraft measurements alone it is very difficult to arrive at a process understanding, but observations are well suited to test models.

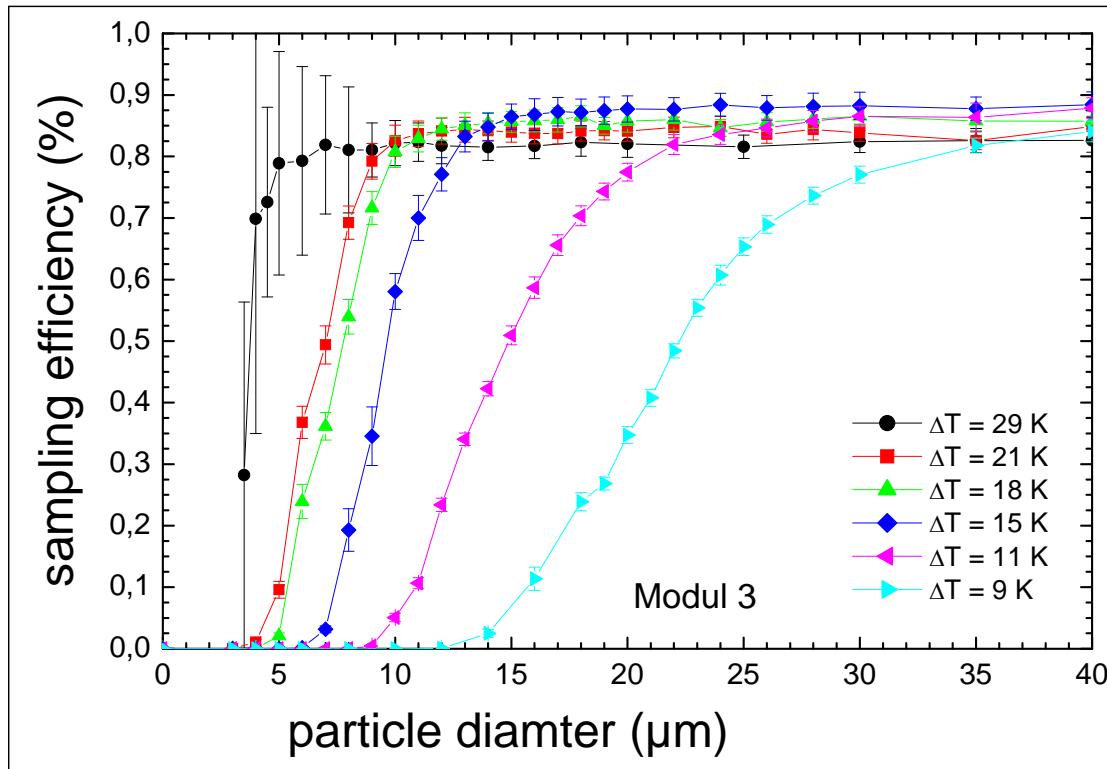

A photograph of a small, white private jet with blue and red stripes on the fuselage. The aircraft is positioned on a runway, facing towards the camera. Its headlights are illuminated, casting a bright glow on the wet asphalt. The background shows a dark sky and some airport infrastructure. In the upper right corner of the slide, the words "Thank you!" are written in a large, white, sans-serif font.

Thank you!

And thanks to:
