Presentation Outline

The Diagnosis Problem

Fault Detection and Isolation (FDI) Approaches

Our Qualitative Continuous Approach

- ▶ bond graphs
- ▶ temporal causal graph analyses
- ▶ monitoring

Model Configuration Changes (Hybrid Systems)

TRR 61 2009

Institut für Robotik und Mechatronik

2

Fault Detection and Isolation (FDI), Diagnosis

Engineered Systems

- complex
- safety critical (e.g., aircraft, nuclear plants)

Hardware Redundancy

- expensive

Functional Redundancy

- exploit system *model*, i.e., model-based diagnosis

11/01/2006

Institut für Robotik und Mechatronik

3

The Diagnosis Problem

System With Nominal (Designed) Behavior

To Detect Anomalies Requires a Reference (Model) of Nominal Behavior

- nominal values from design specification (e.g., for stationary processes)!
- compute nominal behavior from a model

11/01/2006

Institut für Robotik und Mechatronik

4

Model Imperfection

In General, the Estimated State Differs and Diverges From Actual State

- ▶ closed loop required
- ▶ observer (e.g., Kalman filter)

Observer

Prevents Estimated State From Diverging

- ▶ convergence gain

High Gain

- ▶ no spurious residuals
- ▶ however, adaptation to *incipient* fault behavior

Assumption

- ▶ all faults are abrupt

Fault Detection and Isolation (FDI)

Fault Detection Determines Whether a Fault Occurred

- ▶ compute deviation from nominal
- ▶ apply (intelligent) thresholding

Fault Isolation Identifies Deviating Model Parameter(s)

- ▶ match faulty system behavior with modeled faulty behavior
 - i.e., requires *fault models*
- ▶ fault types
 - sensor, actuator, component, structure
- ▶ map parameter deviations to actual components

7

The FDI Model

Values: Qualitative vs. Quantitative

- qualitative models do not require numerical parameter values but diagnosis is less precise
- computational complexity of qualitative methods may be less

Temporal Behavior: Discrete vs. Continuous

- discrete methods may be easier to design but are less precise, coarser
- spurious results

	CONTINUOUS	DISCRETE
QUANTITATIVE	parameter estimation, state estimation	De Kleer & Reiter (combinational circuits)
QUALITATIVE	Mosterman & Biswas	discrete event methods, e.g., Lunze, Sampath <i>et al.</i>

8

Our Qualitative Continuous Approach

A Continuous Representation

Model Represented as a Temporal Causal Graph (TCG)

- ▶ automatically derived from a *bond graph* (Paynter, 1961) by HyBrSim
 - inherent physical conservation constraints
 - suppress spurious behaviors
 - multi-domain (electrical, mechanical, hydraulic)
 - qualitative through quantitative behavior
- ▶ TCG contains
 - system parameters (possible component faults)
 - temporal effects

A Second-Order System

Two Tanks

Bond Graph

- ▶ 0-junctions are common pressure points
- ▶ reversible process, C, state variables (known)
- ▶ irreversible process, R
- ▶ context, Sf, input (known)
- ▶ 1-junctions are common flow points

Assign Causality

Each Power Connection, *Bond*, Has Two Variables

- ▶ *effort* (pressure) and *flow* (volume flow)
- ▶ *product*, *effort* \times *flow*, is power

Sequential Causality Assignment Procedure (SCAP)

- ▶ algorithmic variable ordering

Generate Temporal Causal Graph (TCG)

Allows Additional Processing Based on Boundary Value Analyses

Straightforward From Causal Bond Graph

- temporal effects break algebraic loops with negative feedback

Qualitative Diagnosis

TCG Still Covers Quantitative to Qualitative Behavior

Represent Signals in Basic Qualitative Terms

- , below nominal
- 0, at nominal
- + , above nominal

Requires Corresponding Signal-to-Symbol Transformation

- sophisticated signal processing algorithms

Diagnosis Stages

1. Detect Fault
2. Generate Hypotheses
 - ▶ generate all possible (sets of) fault candidates
3. Refine Hypotheses
 - ▶ prune the fault candidates based on additional information
 - ▶ requires
 - predictions of future behavior
 - monitoring to generate symbols
4. Suspend Diagnosis

10/11/2000

Institut für Robotik und Mechatronik

15

Interpretation by Graph Propagation

Backward Propagation of Detected +/- Deviation in TCG

Example; Too High Pressure in C2, p_{C2}^+

- ▶ hypothesized faults: C2-, Rb2+, R12-, C1-, Rb1+

10/11/2000

Institut für Robotik und Mechatronik

16

Prune Set of Fault Hypotheses

Forward Propagation of Each Parameter Deviation in TCG

- ▶ prediction, signature, of future measurements for each fault
- ▶ develop polynomial in λ (dt) to take temporal effects into account

Example; Rb2+

Hypothesis Refutation

Validate Each Fault By

- ▶ comparing with other measurements (not just the one that generated it)
- ▶ information from each individual measurement
 - magnitude change
 - discontinuous change
 - first order effect
 - additional information
 - second order effect
 - steady state

Requires Time Window to Generate These Symbols Because of Noise

- ▶ monitor during transient after fault \Rightarrow progressive monitoring

Progressive Monitoring

System Behavior Convolutes the Predicted Transient at Time of Failure

- ▶ dynamically change the signature

k	measure

k	signature2
0	+ - +

↓
no match!

Only Model Observable Behavior!

Final Diagnosis

Suspend When One of Three Classes of Behavior Is Detected:

- ▶ compensatory response
- ▶ reverse response
- ▶ inverse response

Per Signal

- ▶ not all feature detection simultaneously suspended

Two Tank Diagnosis

Monitoring Example

► Rb2+

Secondary Sodium Cooling Loop

Sixth Order Nonlinear Model

22 Faults

- ▶ accurate for all but one fault, i.e., Cev-

10/01/2000

Institut für Robotik und Mechatronik

23

Combustion Engine Cooling System

Noise

- ▶ model
- ▶ measurements

Difficult to Model

- ▶ algebraic loops

Mode Switching

- ▶ large leak
- ▶ small leak

Parallel FDI

10/01/2000

Institut für Robotik und Mechatronik

24

Hybrid Diagnosis

Structural Changes

Consider a Pressure Controlled Connecting Valve

For Rb2- (leakage) the Valve may Close and the Prediction Changes

- ▶ OPEN: p_{C2}^{0-}
- ▶ CLOSED: p_{C2}^{0+}

This Could Lead to Incorrect Diagnoses

Causal Changes

Closing the Valve Changes Causality in the System

- ▶ OPEN: $f_{RI2} = p_{RI2} / R12$
- ▶ CLOSED: $p_{RI2} = f_{RI2} * R12$

Generate All TCGs?

- ▶ combinatorial explosion

Parametrize TCG With Mode!

- ▶ parametrized signatures
- ▶ constraint satisfaction problem (CSP)

TUM 2000

Institut für Robotik und Mechatronik

27

Causal Changes

For Two-Tank

▶ two modes

- OPEN: α
- CLOSED: $-\alpha$

▶ leakage, Rb2-

$$f_{Rb1} = -\alpha\lambda - \lambda^2$$

signature

TUM 2000

Institut für Robotik und Mechatronik

28

Mode Transition Constraints

One Fault Has Multiple Possible Behaviors

- ▶ $Rb2(-\alpha): 0\ 0\ -$
- ▶ $Rb2(-\alpha): 0\ +\ -$

k	measure

1	0
2	-
3	- -
4	- -

k	measure
0	0
1	+
2	+ +
3	+ +
4	+ +

Interaction Stops Diagnosis

3	- +
---	-----

Constraint Satisfaction Problem

For Each Prediction

- ▶ e.g., $Rb2(-\alpha) \lambda - \lambda^2 \Rightarrow \{0, 1-\alpha, -1\}$

Find α Such That Observation Is Satisfied

- ▶ e.g., $\{1, 1\}$

Under the Assumption That Higher Order Effects Propagate Down

- ▶ only overwrite nominal, 0, values
- ▶ e.g., $Rb2(-\alpha) \Rightarrow \{1-\alpha, 1-\alpha, -1\}$ can be satisfied by $\alpha = 0$ (valve closed)

Conclusions

Model-Based Diagnosis Systems

- method classification
 - qualitative vs. quantitative
 - discrete vs. continuous
- close interaction between a number of fields
 - modeling
 - instrumentation technology
 - signal processing
 - analyses (constraint satisfaction)

A Qualitative Continuous Method Can Be Successful

- accurate but less precise than quantitative approaches (pre-processing)
- for stationary processes an observer may not be required

10/04/2000

Institut für Robotik und Mechatronik

31

TRANSCEND

Bond Graph Based Approach

- highly constrained continuous models

Graph Propagation

- fault hypotheses
- predictions

Signal-to-Symbol Transformation for Pruning

- discontinuities
- magnitude deviations
- first-order behavior
- second-order behavior?
- steady-state?

Institut für Robotik und Mechatronik

32

Current and Future Work

Hybrid (Continuous and Discrete) Systems

- ▶ **engineered systems combine**
 - **physical plant, continuous**
 - **controller, discrete**
- ▶ **complex models**
 - **piecewise simpler**
 - **adapted to data acquisition bandwidth**

Bond Graph Based Diagnosis Extended by Using Parametrized Causality

Still, Lots to Be Done!
