Knowledge for Tomorrow

# Understanding Precipitation Initiation in Mixed Phase Clouds

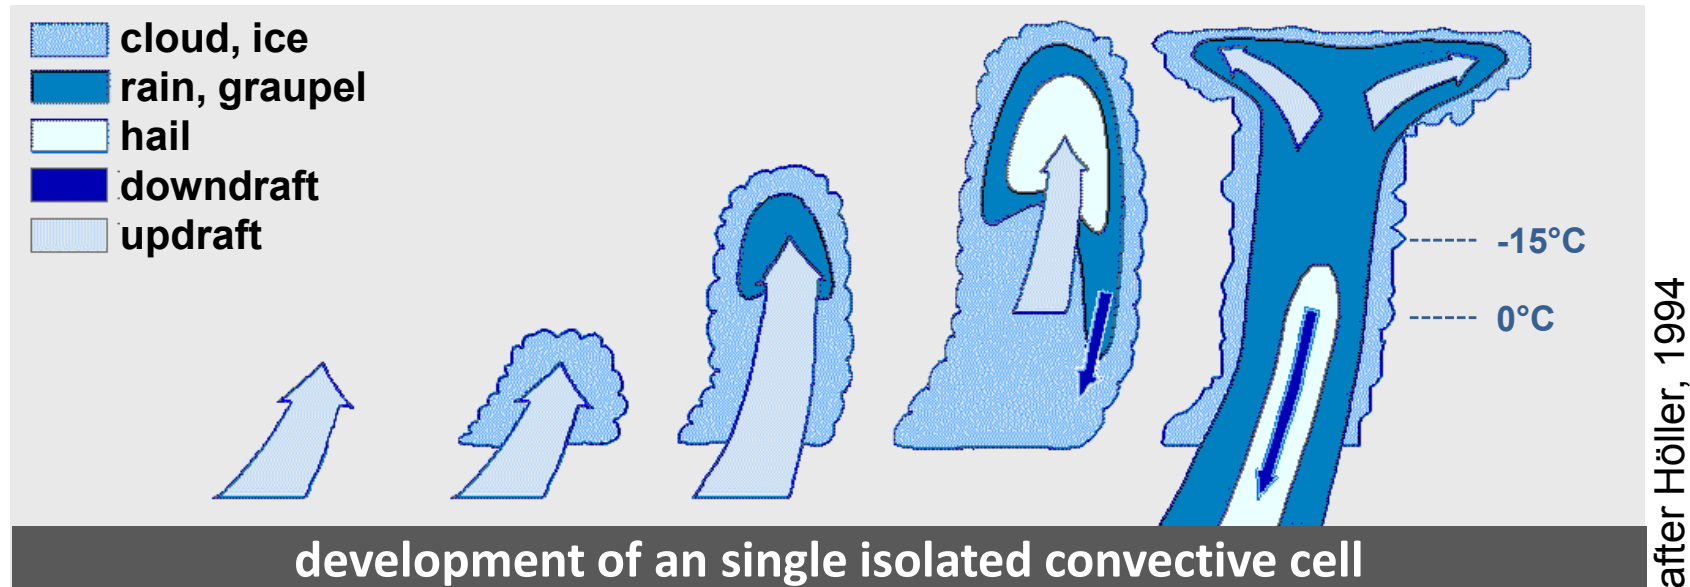

## Key Questions:

- when does precipitation initiation take place?
- when will ice be formed?
- how is precipitation initiation related to ice formation?

## Answer from Radar Point of View:

- dual-polarization hydrometeor classification
- reflectivity gives water / ice content
- ZDR, KDP, ... tells about particle habit

# Understanding Precipitation Initiation in Mixed Phase Clouds

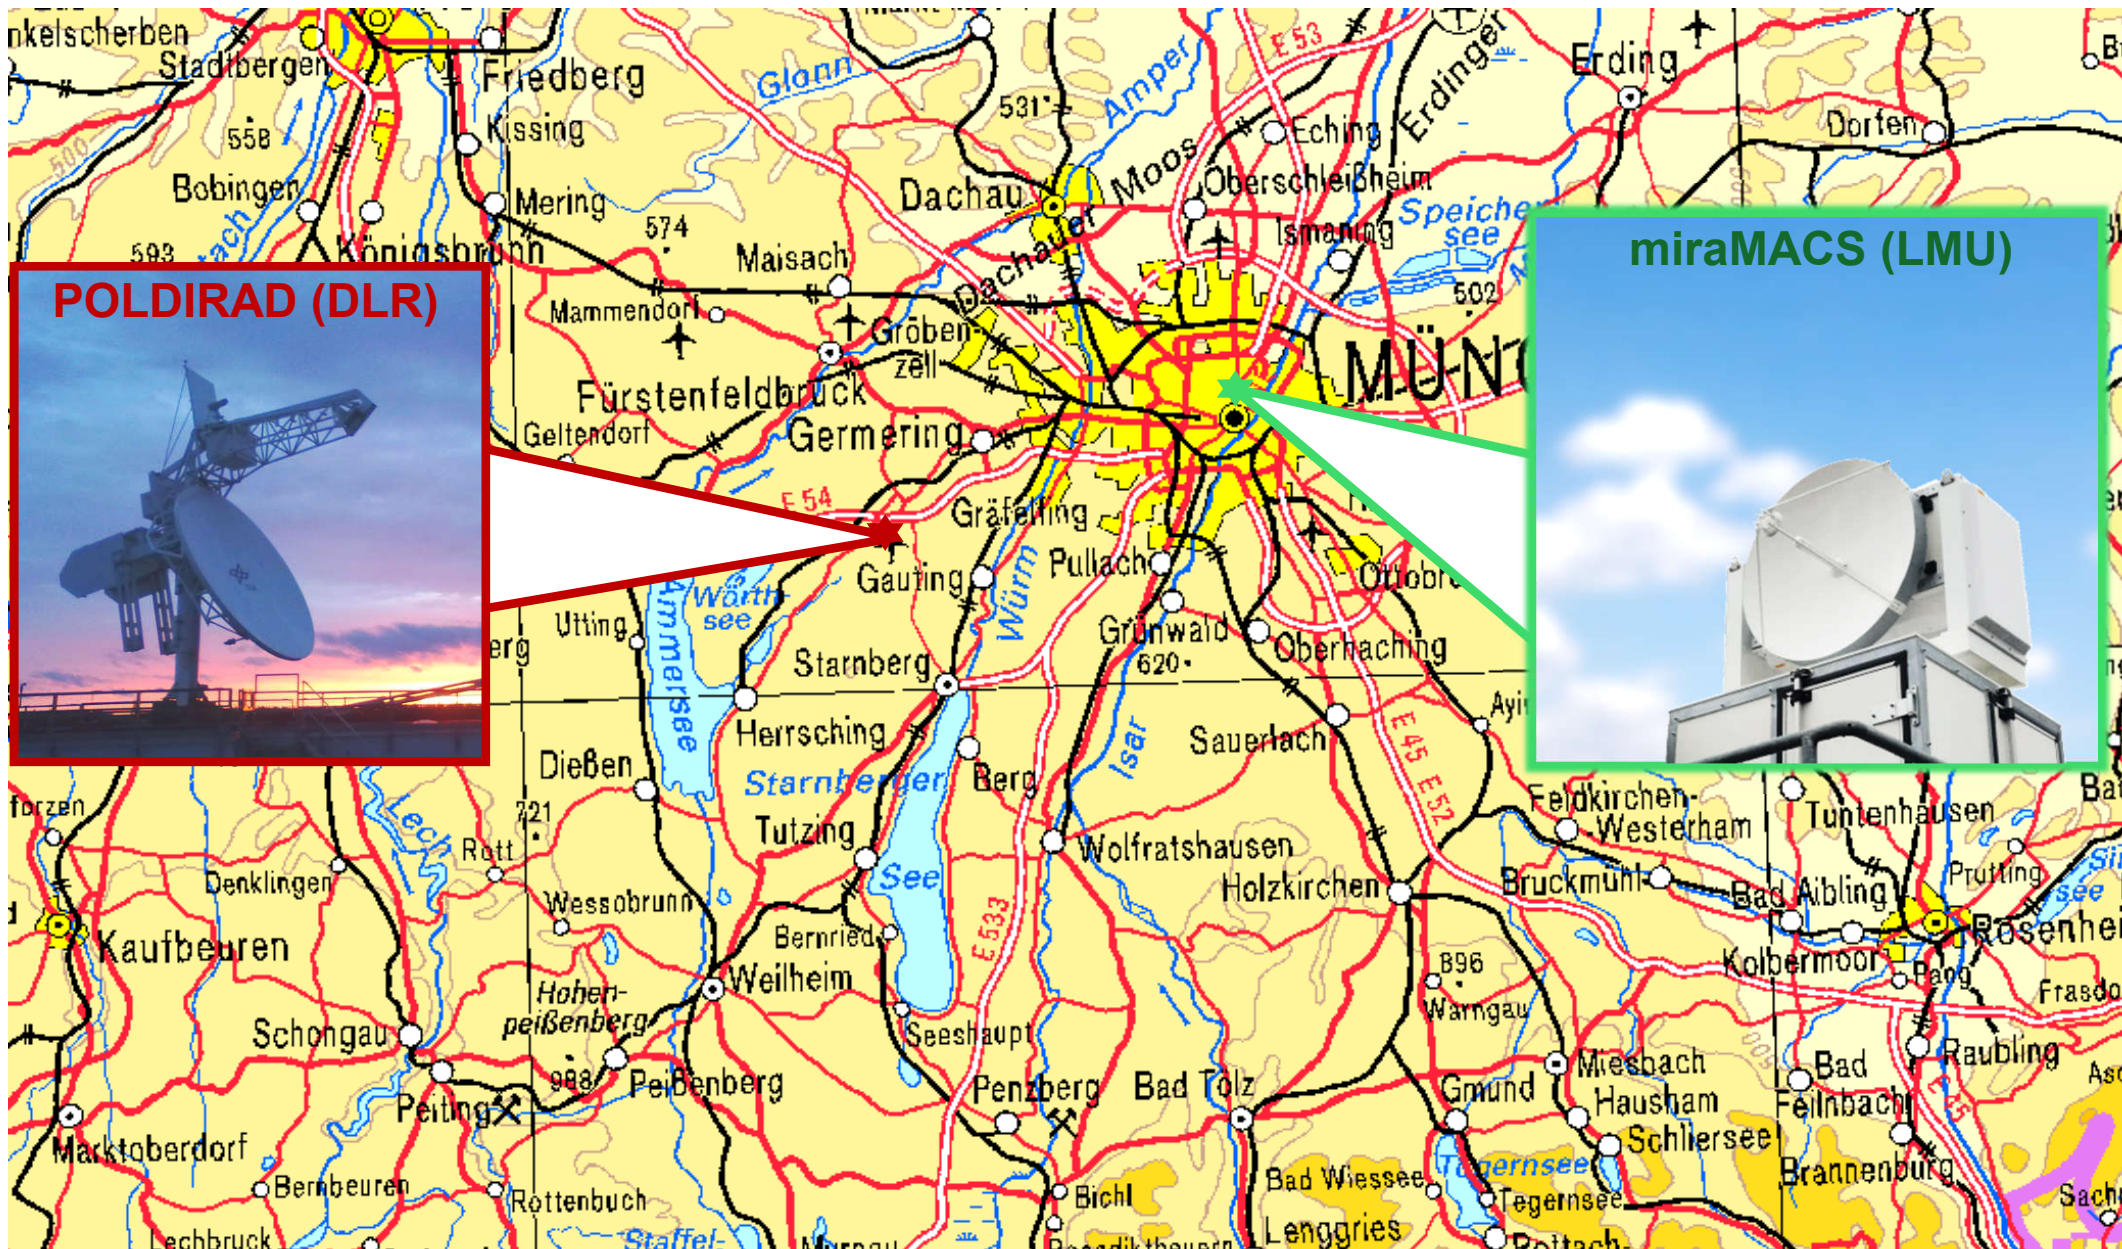

## Answer from Radar Point of View:

- dual-polarization hydrometeor classification
- reflectivity gives water / ice content
- ZDR, KDP, ... tells about particle habit

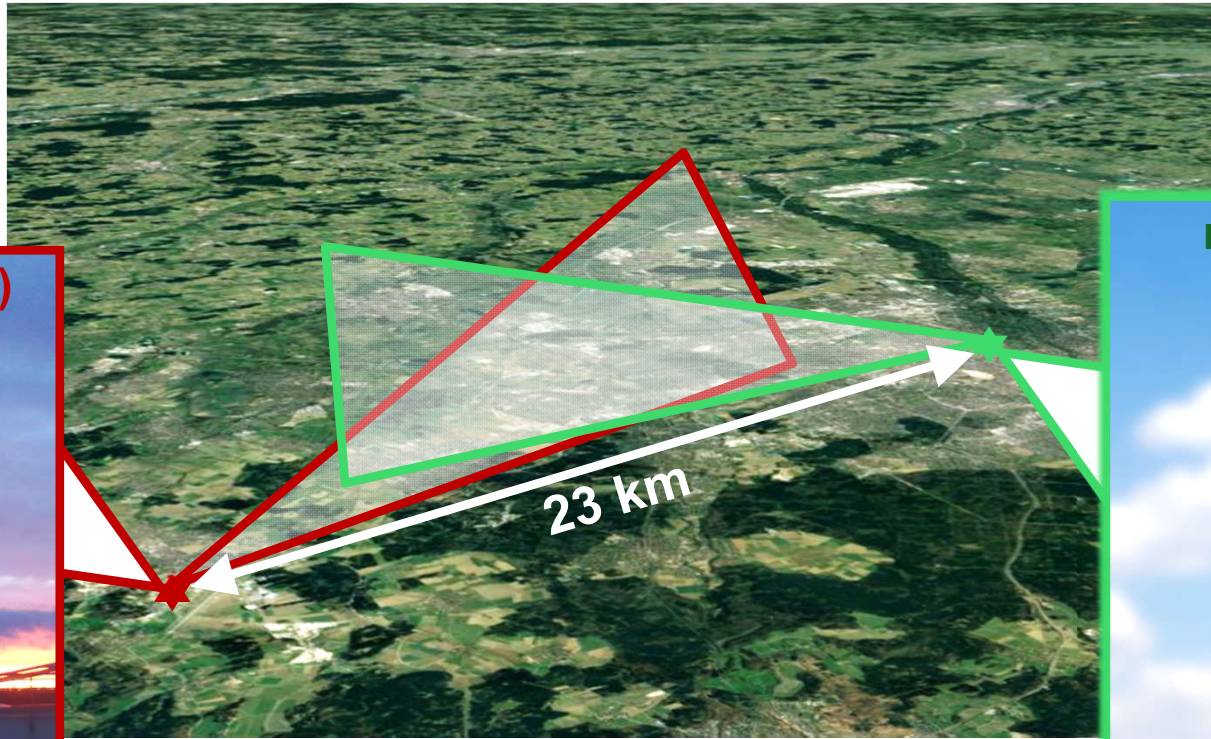

## Limitation:

- C-band radar is not sensitive enough for small cloud particles
- cloud radar (Ka- or W-band) is limited in range and suffers from attenuation
- both can derive only partly microphysical quantities or particle habits

# Coordinated Measurements Poldirad – MIRA35

# Coordinated Measurements Poldirad – MIRA35

**POLDIRAD (DLR)**

- C-band weather radar (5.5 GHz, 250 kW)
- operated at DLR Oberpfaffenhofen
- 4.5 m antenna 1° beam-width
- range res. 150 m, max 120 km
- full polarimetric (STAR and AlthV) (ZDR, LDR, KDP,  $\rho_{HV}$ )

**miraMACS (LMU)**

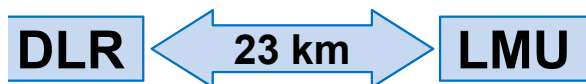

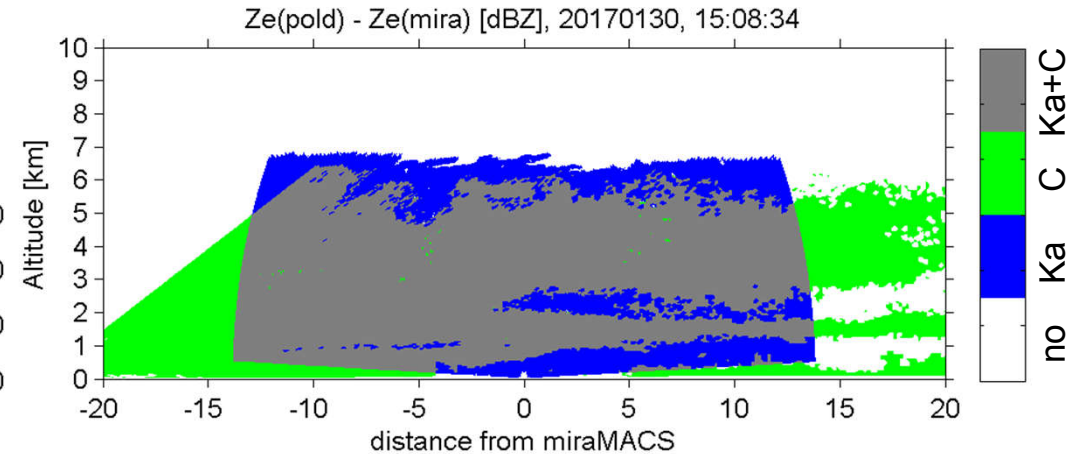

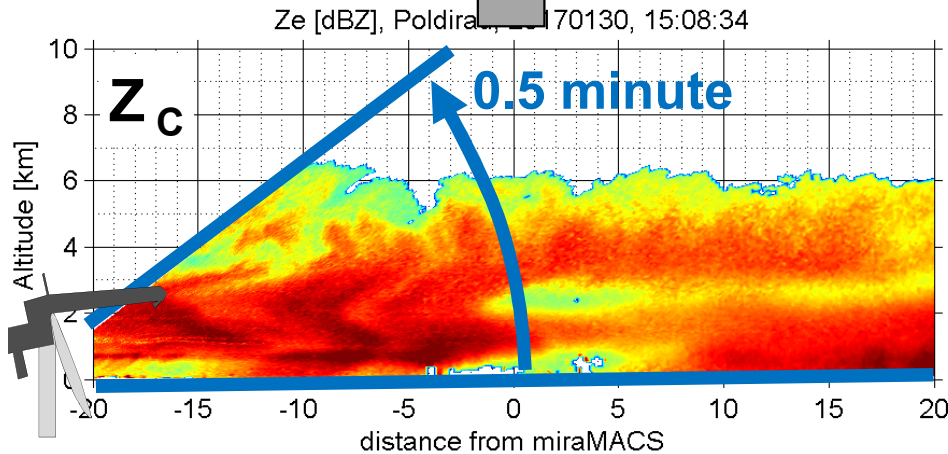

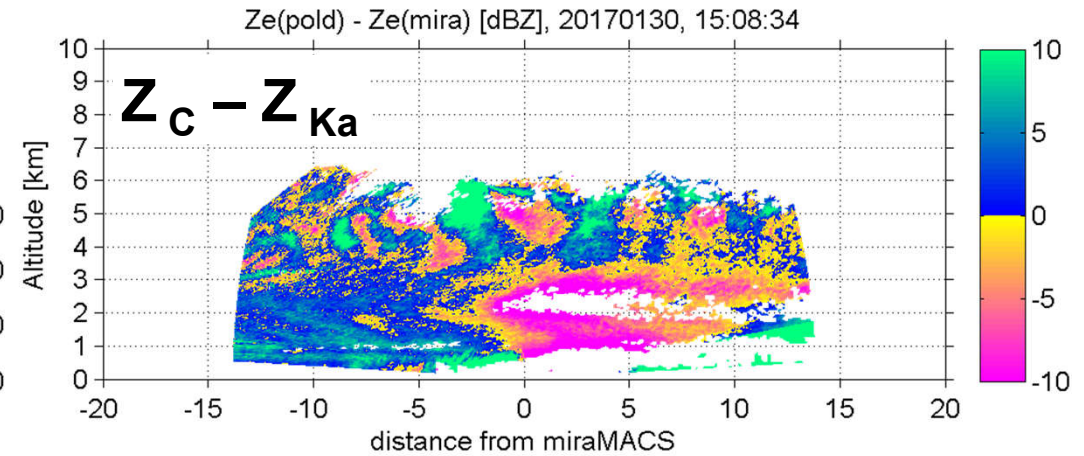

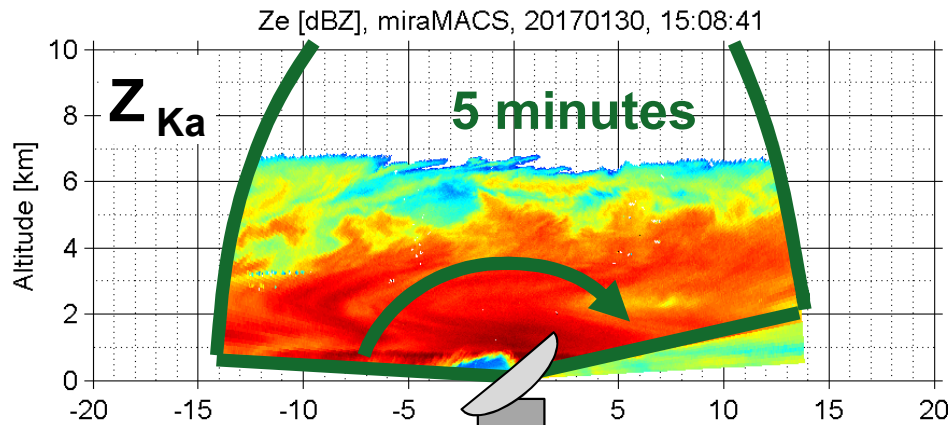

- Ka-band cloud radar (scanning) (36 GHz, 30 kW)
- operated at LMU Munich city
- 1 m antenna 0.6° beam-width
- range res. 30(60) m, max 15(30) km
- linear depolarization ratio LDR

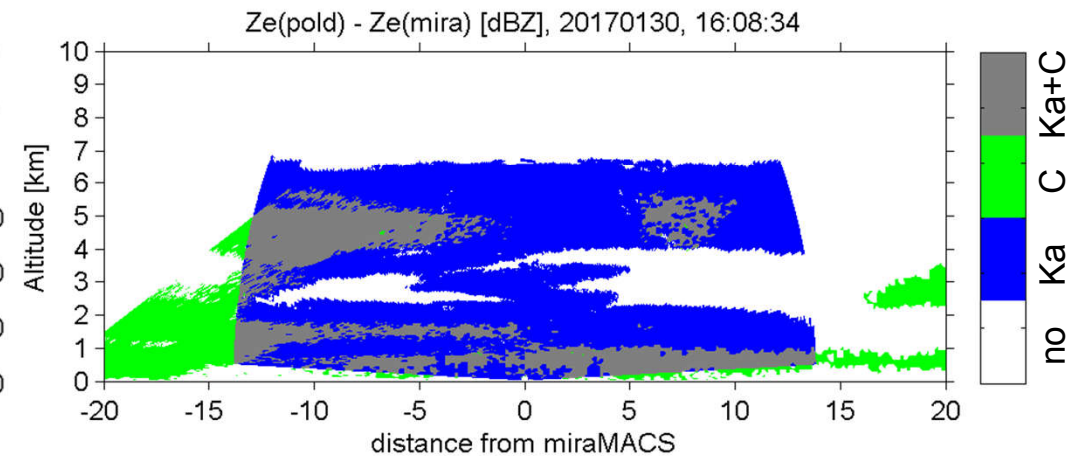

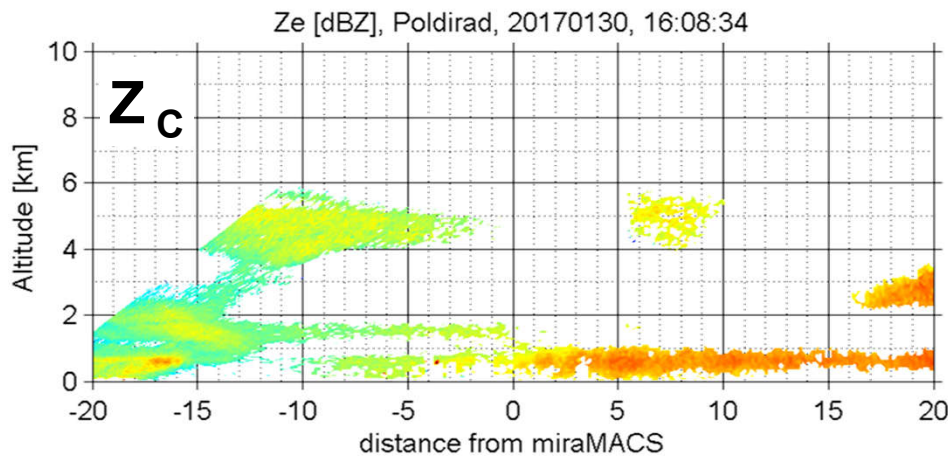

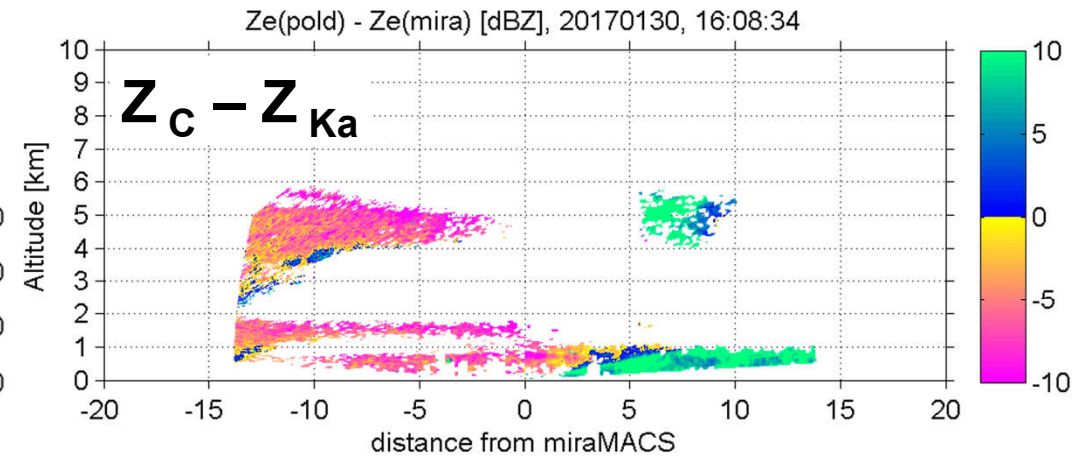

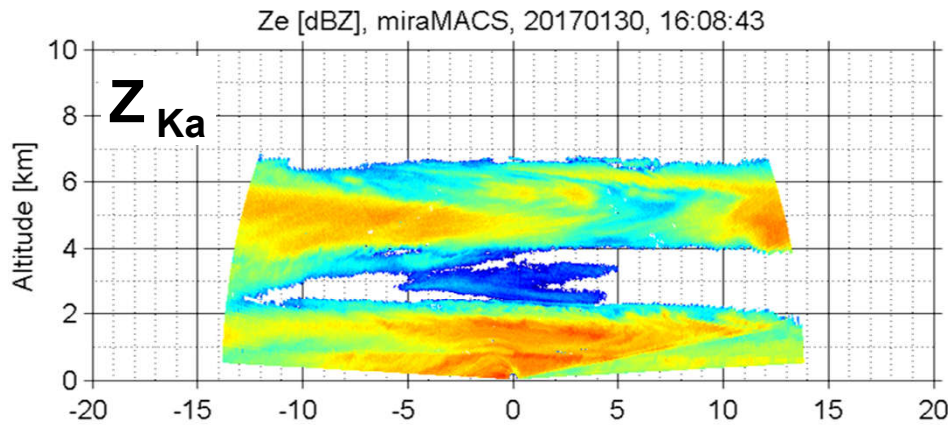

STAR: simultaneous transmit and receive  
AlthV: alternate transmit and receive horizontal and vertical

# Example Measurement 2017-02-08 09:08

# Sensitivity Issue – MDS

## Minimum detectable/discernable signal (MDS):

- C-band POLDIRAD:  
(1  $\mu$ s pulse, 64 samples)  
~ -26 dB at 5 km  
~ -17 dB at 15 km
- Ka-band miraMACS:  
(0.2  $\mu$ s pulse, 256 samples)  
~ -40 dB at 5 km  
~ -31 dB at 15 km

# Towards Ice Particle Effective Radius

Effective Radius commonly used for optical remote sensing  
(Lidar or passive remote sensing with satellites)

$$r_{eff} = \frac{m(3)}{m(2)} = \frac{\text{volume}}{\text{area}}$$

$$r \gg \lambda$$

Hansen (1971)

Schumann et al. (JAS, 2011):

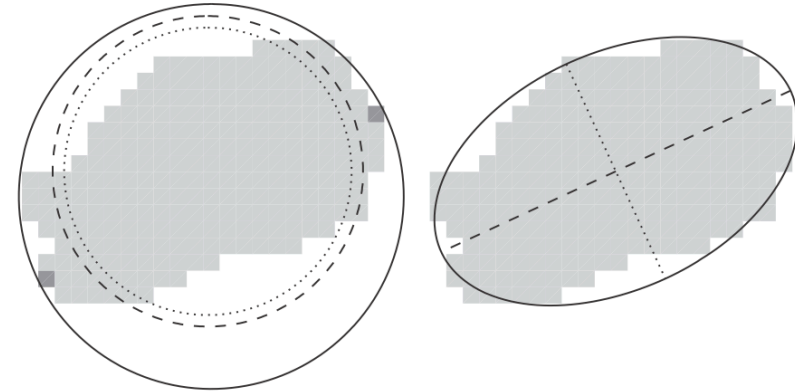

- “The effective particle radius is defined such that the *extinction coefficient* (optical depth) is proportional to the *ice water content* (IWC) [ice water path (IWP)] divided by the *effective radius* (Hansen and Travis 1974; Garrett et al. 2003)”
- “While the *volume mean radius* can be computed for given *IWC*, *ice bulk density*, and *number of ice particles*, the *effective radius* depends on details of the *particle habits* and the *particle size distribution* (PSD) (McFarquhar and Heymsfield 1998)”

# Towards Ice Particle Effective Radius

## Mass-size relationship

- spheroid approximation  
(Hogan et al., 2011)

aspect ratio 0.6

- mass approximation  
based on various world-wide field campaigns  
(Brown and Francis, 1995)

$$M(D) = 1.677 e^{-1} D^{2.91}$$

$$D \leq 0.01 \text{ cm}$$

$$M(D) = 1.66 e^{-3} D^{1.91}$$

$$0.01 < D \leq 0.03 \text{ cm}$$

$$M(D) = 1.9241 e^{-3} D^{1.9}$$

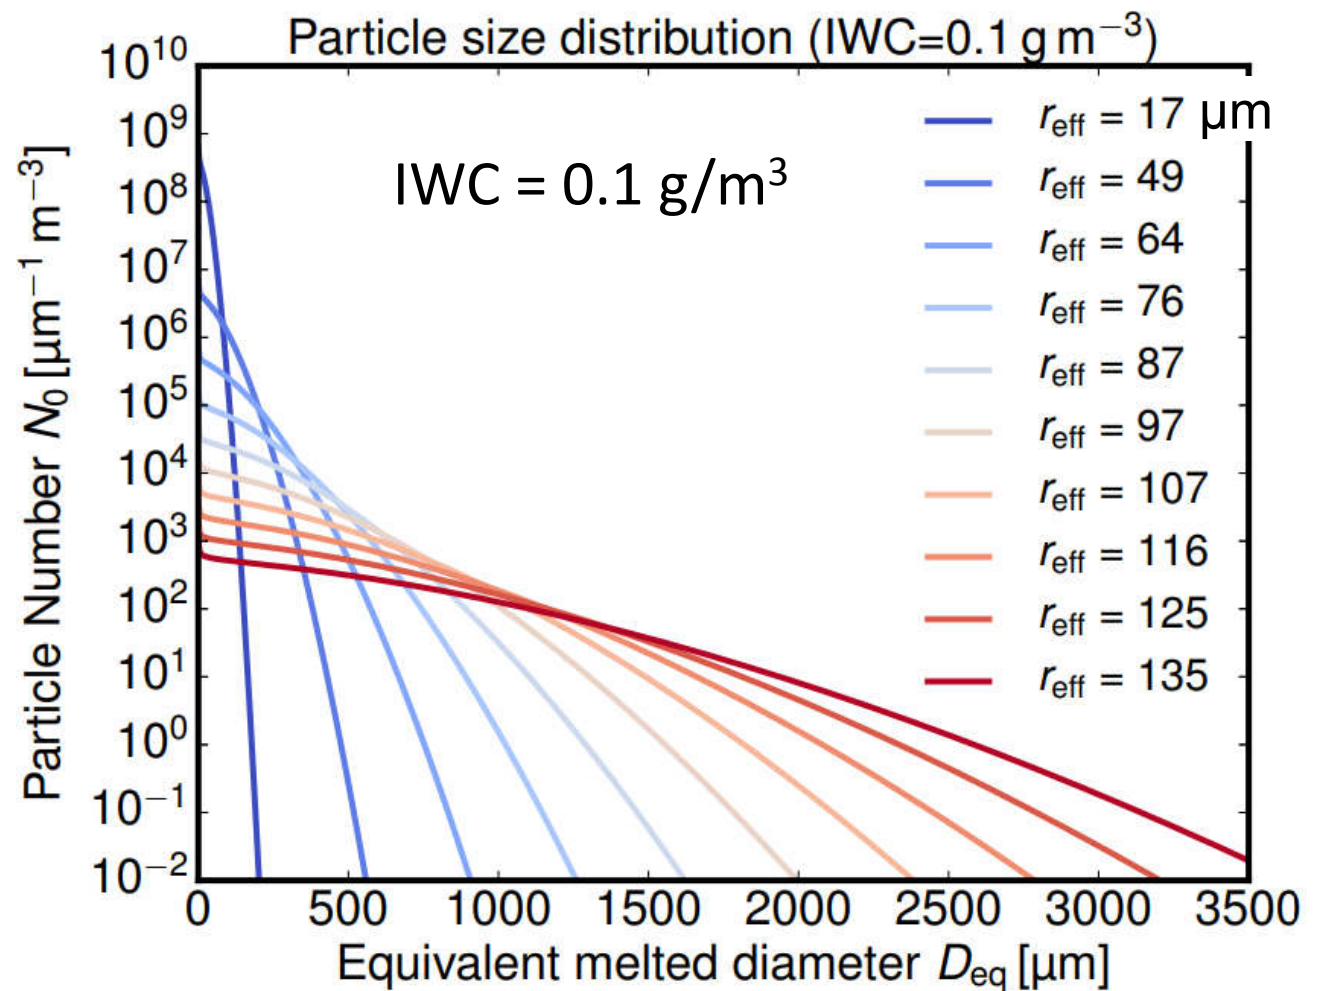

$$D > 0.03 \text{ cm}$$

# Towards Ice Particle Effective Radius

## Particle size distribution

modified gamma function  
fitted to same in-situ data  
used for  $M(D)$  normalized  
by the volume-weighted  
diameter  $D_m$  and the  
intercept parameter  $N_0$

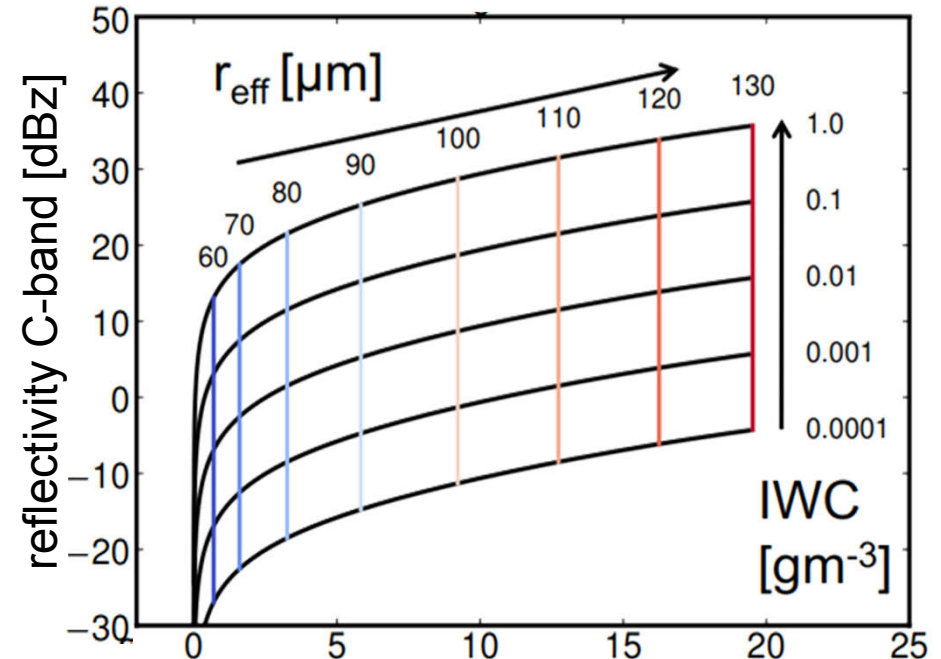

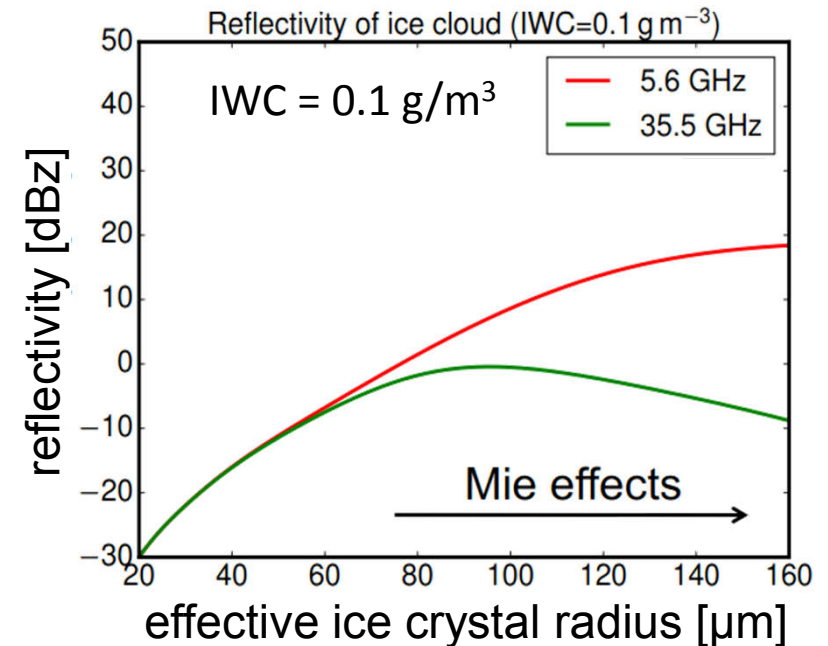

(Delanoë et al., 2014)

# Towards Ice Particle Effective Radius

## Particle size sensitivity of the Dual Wavelength Ratio

- Mie effects cause lower reflectivities for larger  $r_{\text{eff}}$
- dual wavelength ratio (DWR) for retrieval of effective radius
- reflectivity (C-band) for retrieval of ice water content (IWC)
- attenuation is negligible for ice

dual wavelength reflectivity ratio C/Ka [dB]

# Multi-Wavelength Microphysics Retrieval

## Dual-polarization C- and Ka-band Retrieval:

- dual-wavelength reflectivity ratio → effective radius of ice particles
- reflectivity (long wavelength) → ice water content IWC
- dual-polarization → hydrometeor classification  
→ particle habit

## Lessons learned:

- calibration of both radars essential
- optimizing of C-band sensitivity necessary
- scan timing / advection to be considered
- additional W-band radar could improve retrieval
