Objectives

Remote sensing (RS) data are becoming increasingly relevant in environmental monitoring to support decision-making processes. However, an essential requirement for method development is a suitable in-situ database. The DEMMIN test field aims at this property and combines satellite image data, in-situ data with information from farmers and foresters to improve the acquisition of valuable knowledge with three objectives:

- 1) Method Development
- 2) RS Data Validation
- 3) Knowledge Transfer

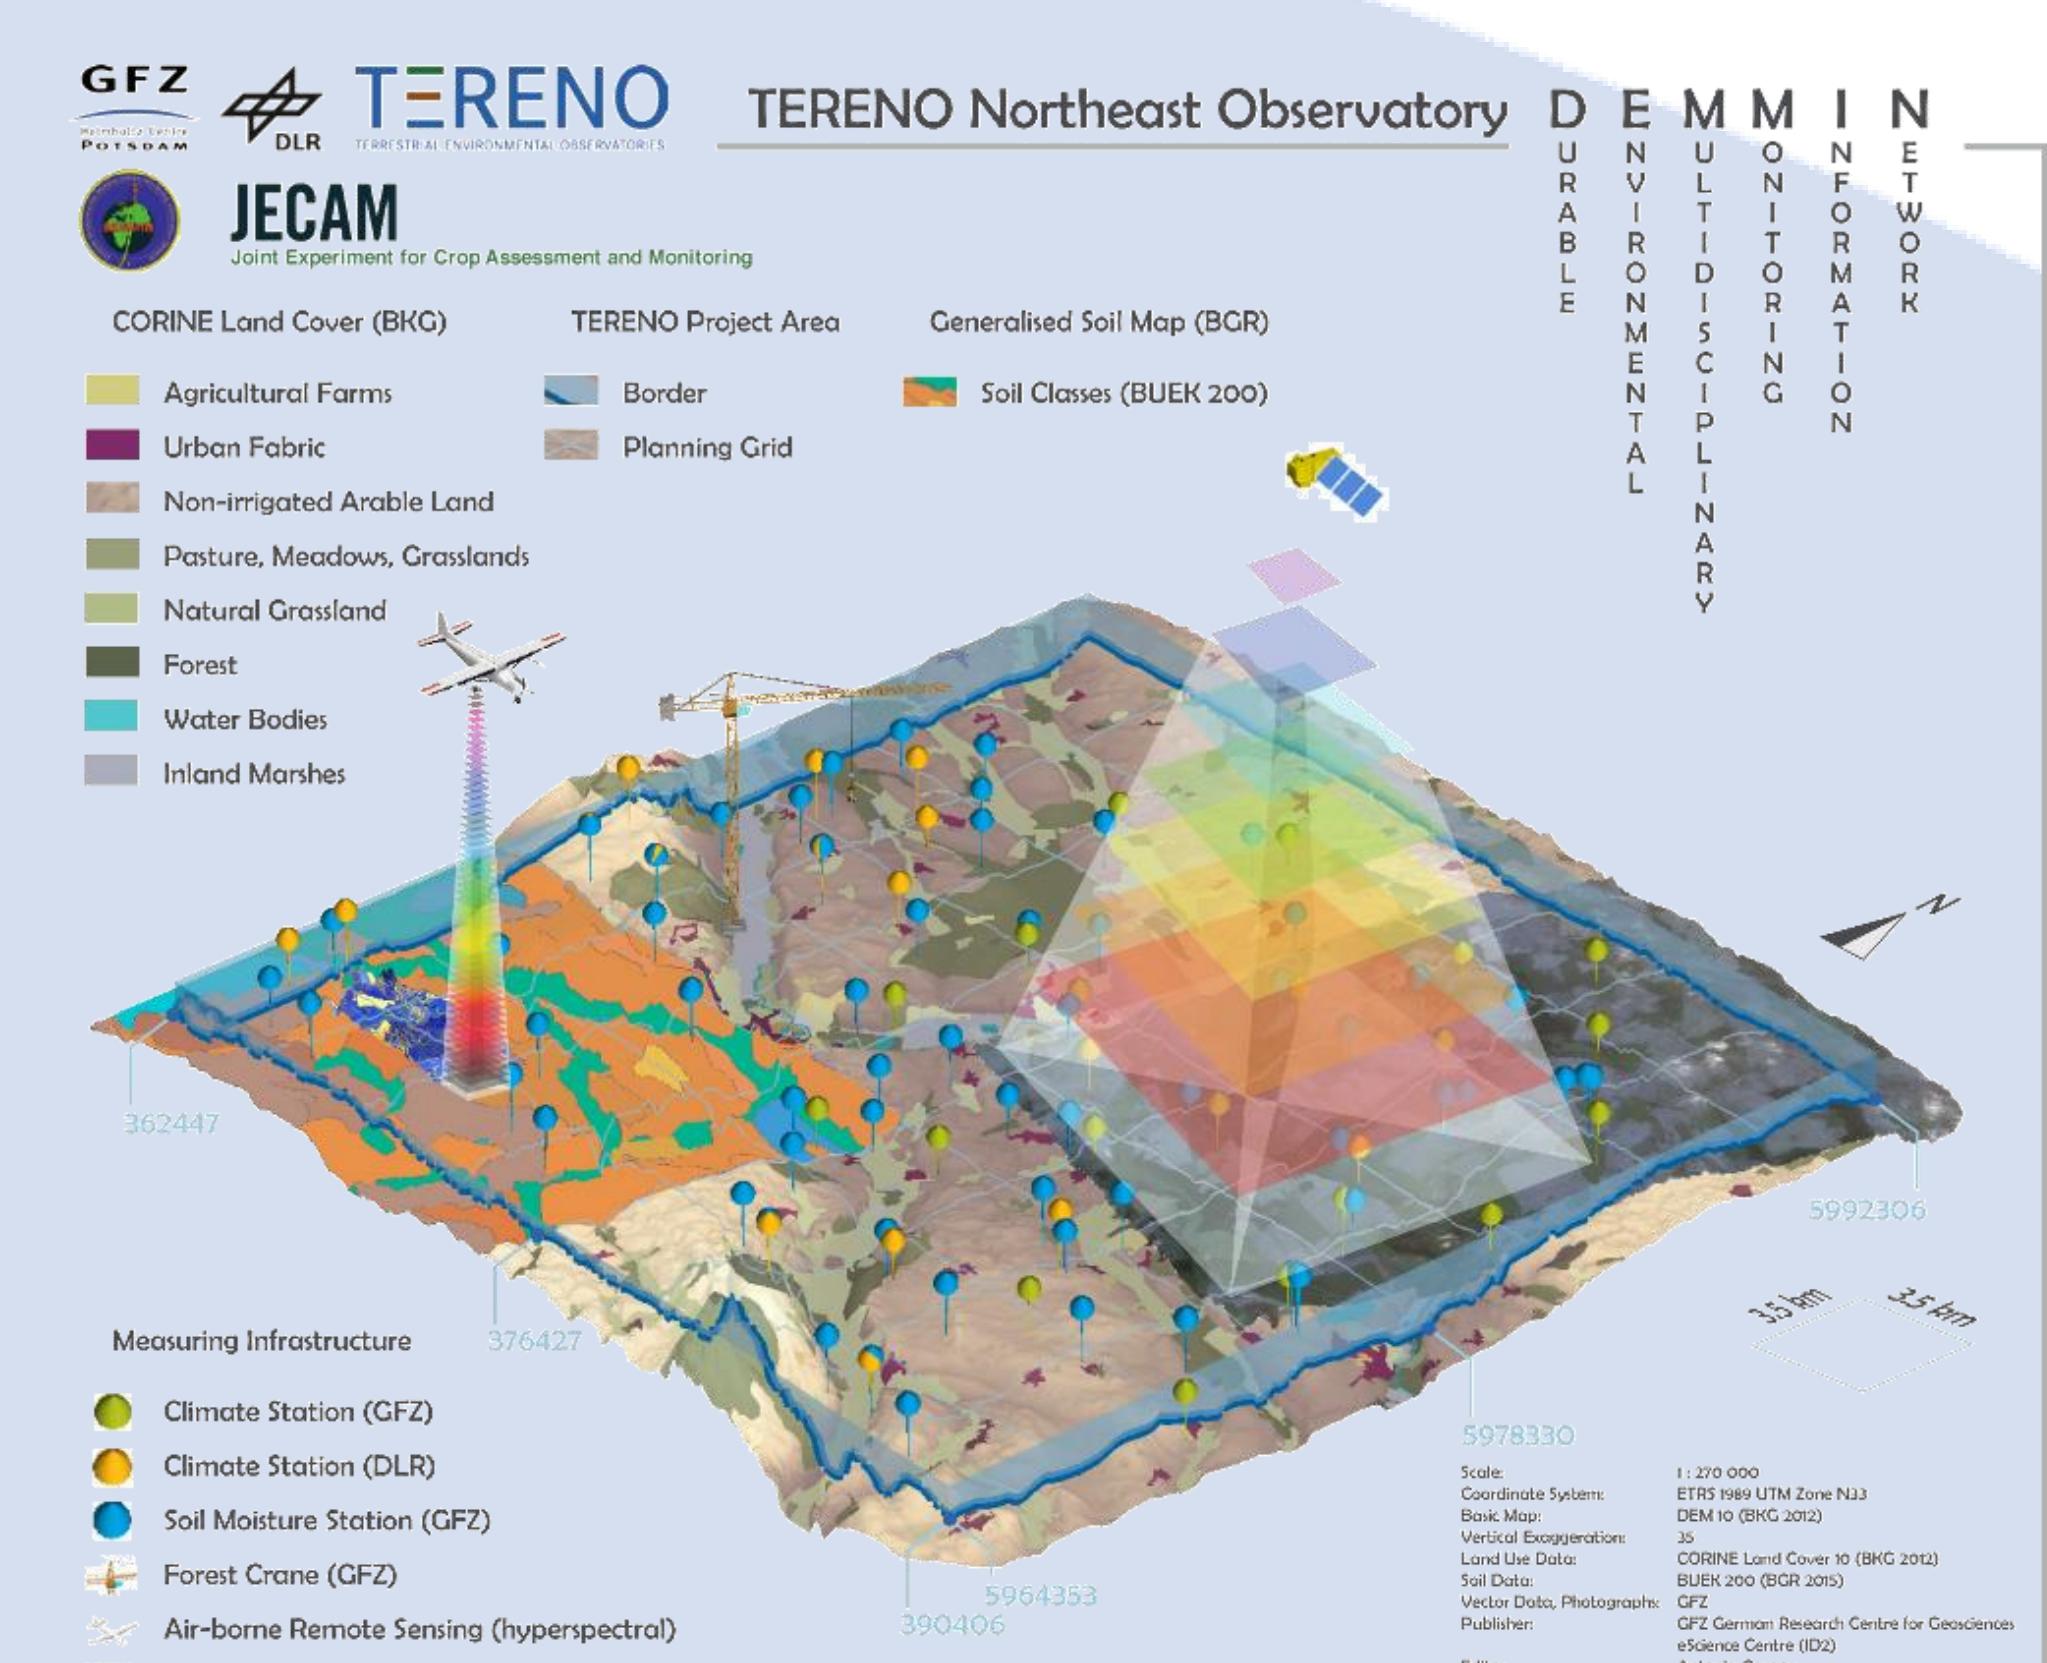

The test site is an intensively used agricultural ecosystem. In the north the topography with an altitude difference 0 – 84.5 m above sea level is rather flat and in the south hilly to undulating. Cause of significant differences in parent substrate material and relief a high spatial variability of soil types are developed.

The location of the gauging station is linked to these different conditions and its according landuse.

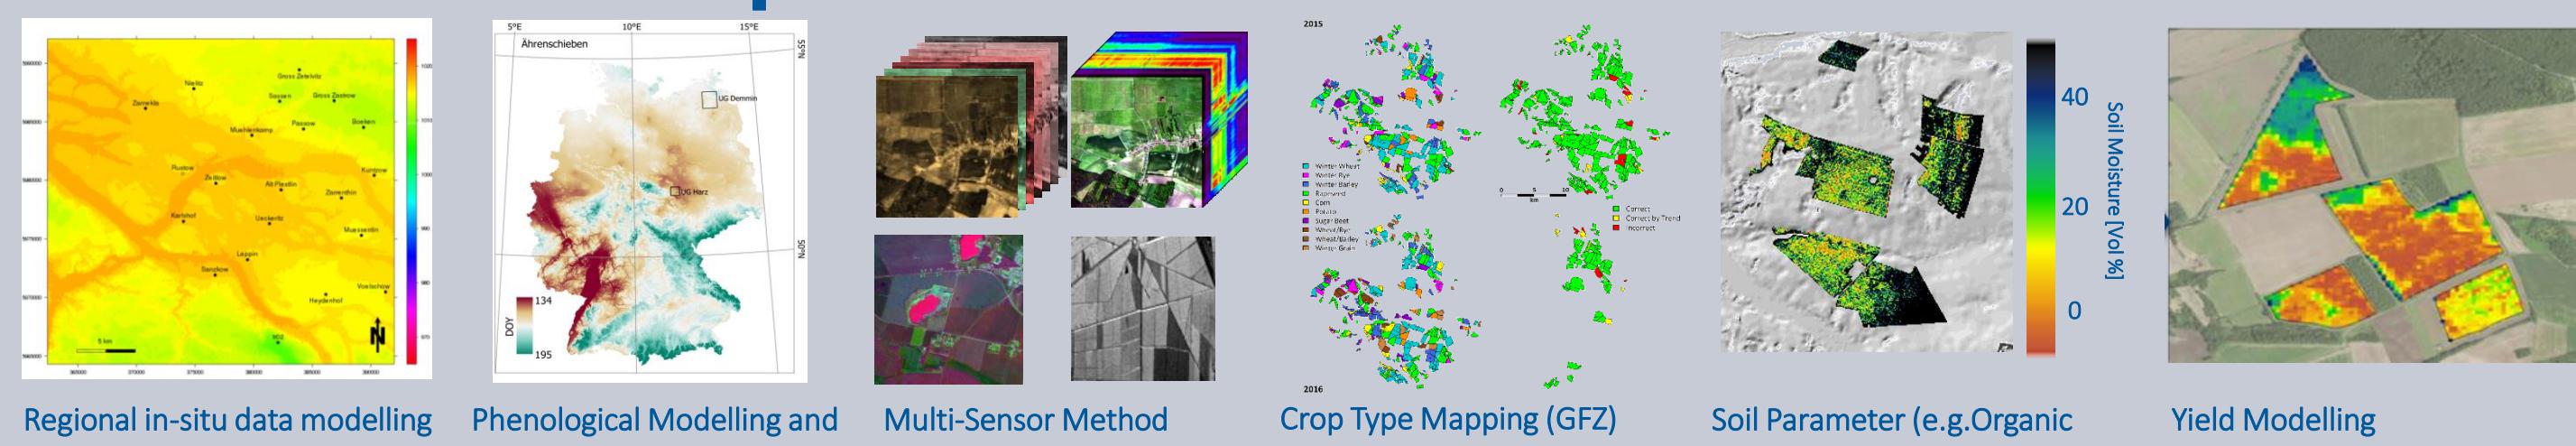

DEMMIN

DEMMIN 2.0 Concept

1) Method Development

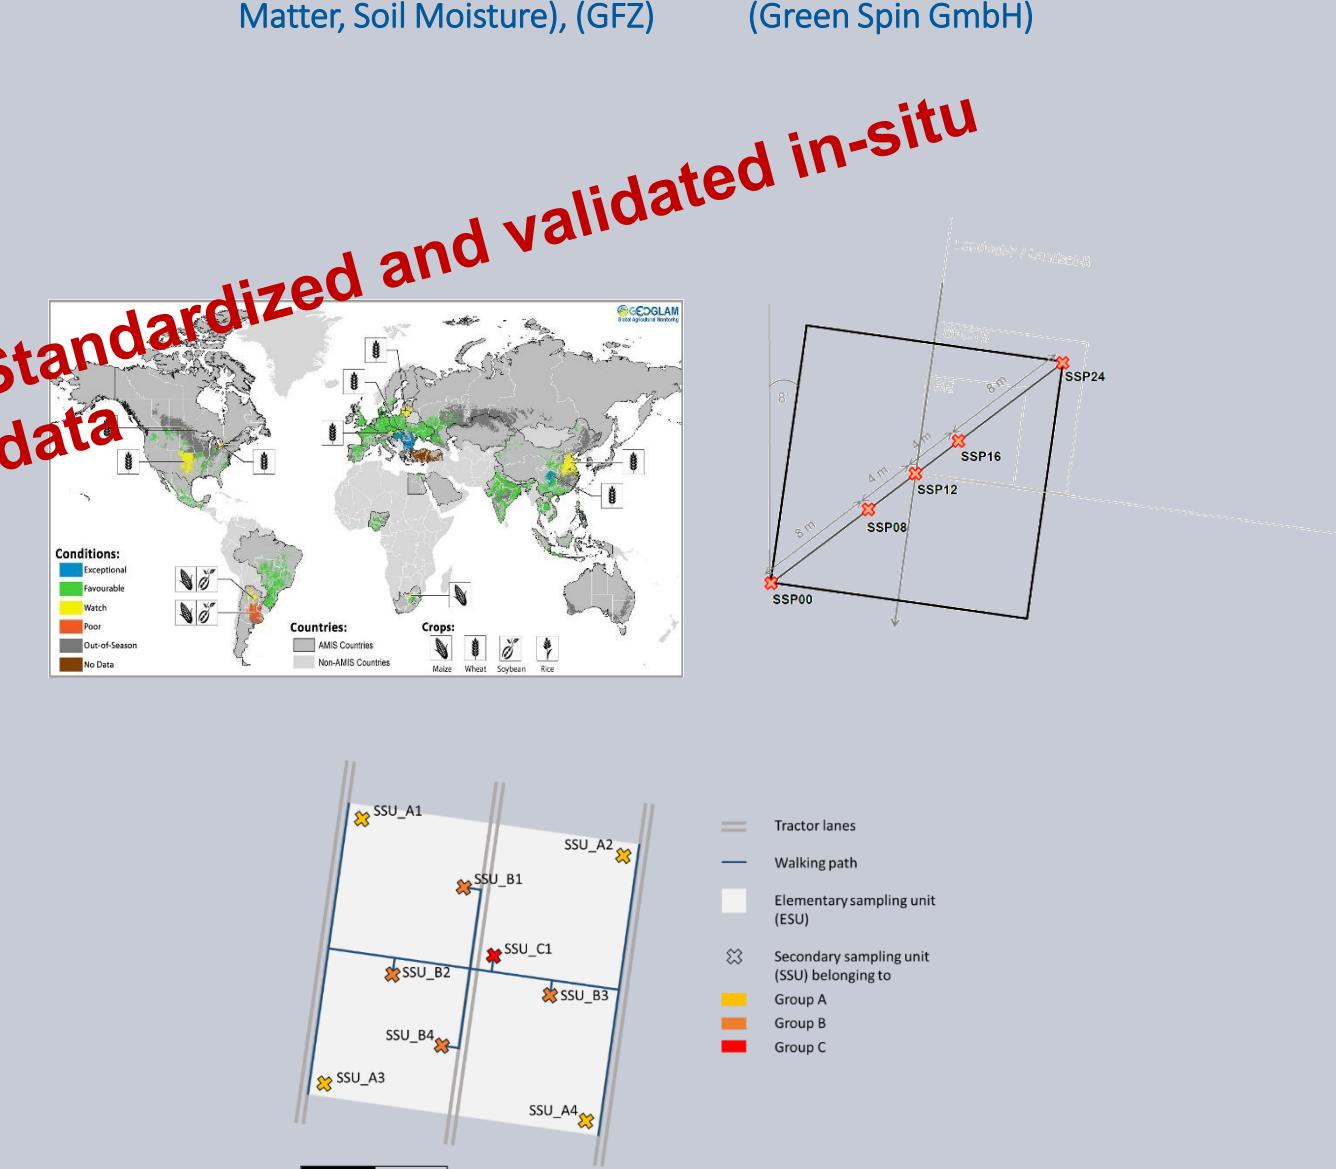

2) RS Data Validation

- Method validation (e.g. JECAM crop type mapping, SAR inter-comparison experiment)
- HYPERNETS project (spectrometer for surface reflectance validation)

3) Knowledge Transfer

- Field campaigns for universities
- Standardized acquisition of field data

Cooperation / Network / Data

Data

- Secure data transfer
- QA/QC of data
- Value-added information
- Open data access (via DOI)

Data Discovery Portal

<http://teodoor.icg.kfa-juelich.de/ddp/>

Cooperation / Networking

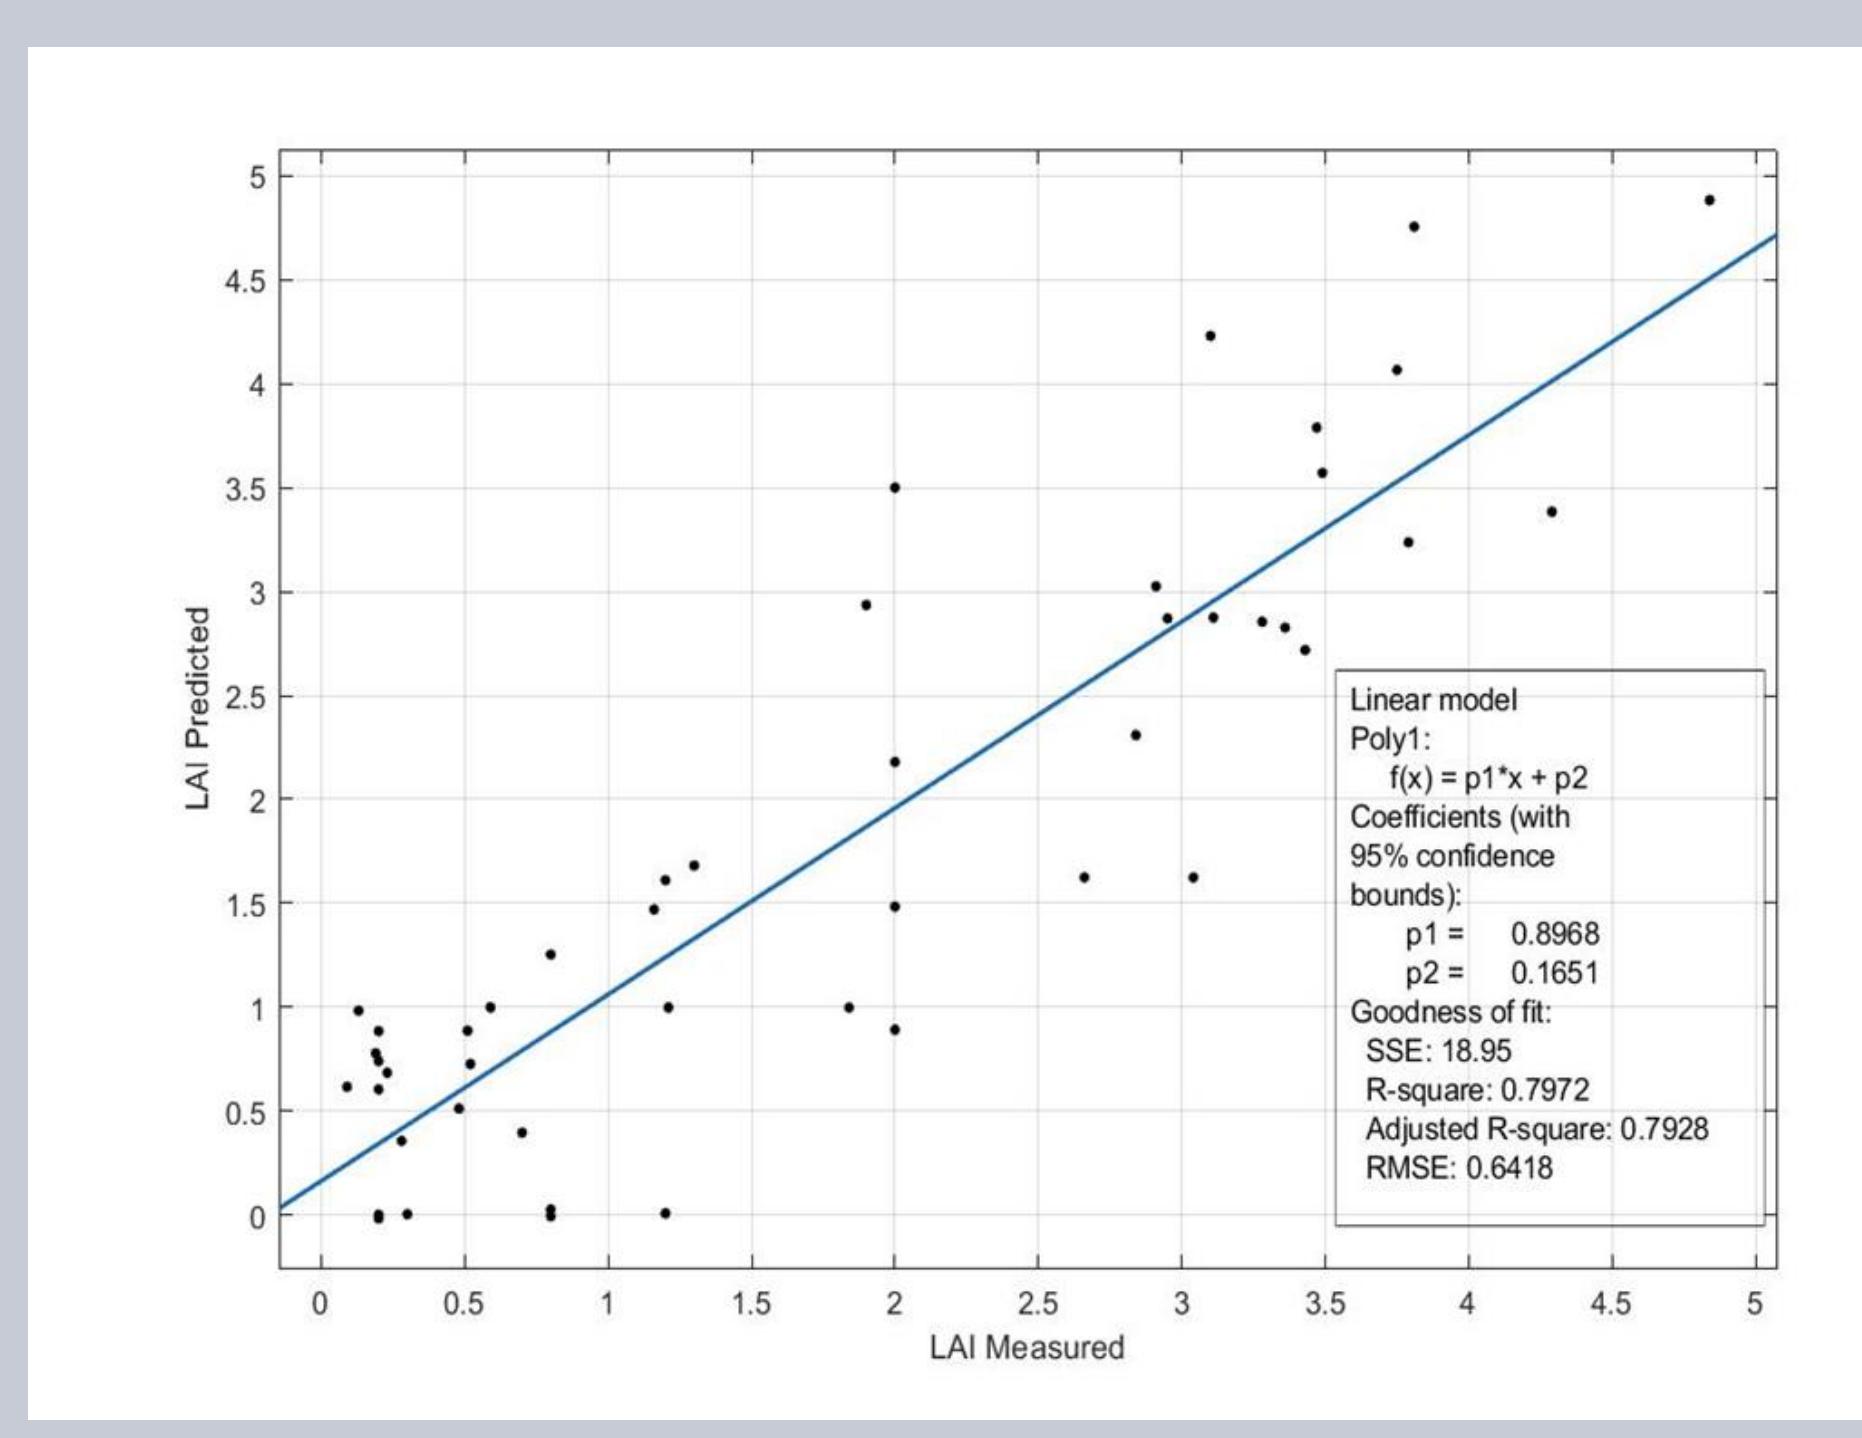

- Cooperation with national and international universities, research institutes, companies and initiatives:
- Official German site of the **GEOGLAM** / **JECAM** network
- National & international projects

Selected Scientific Projects

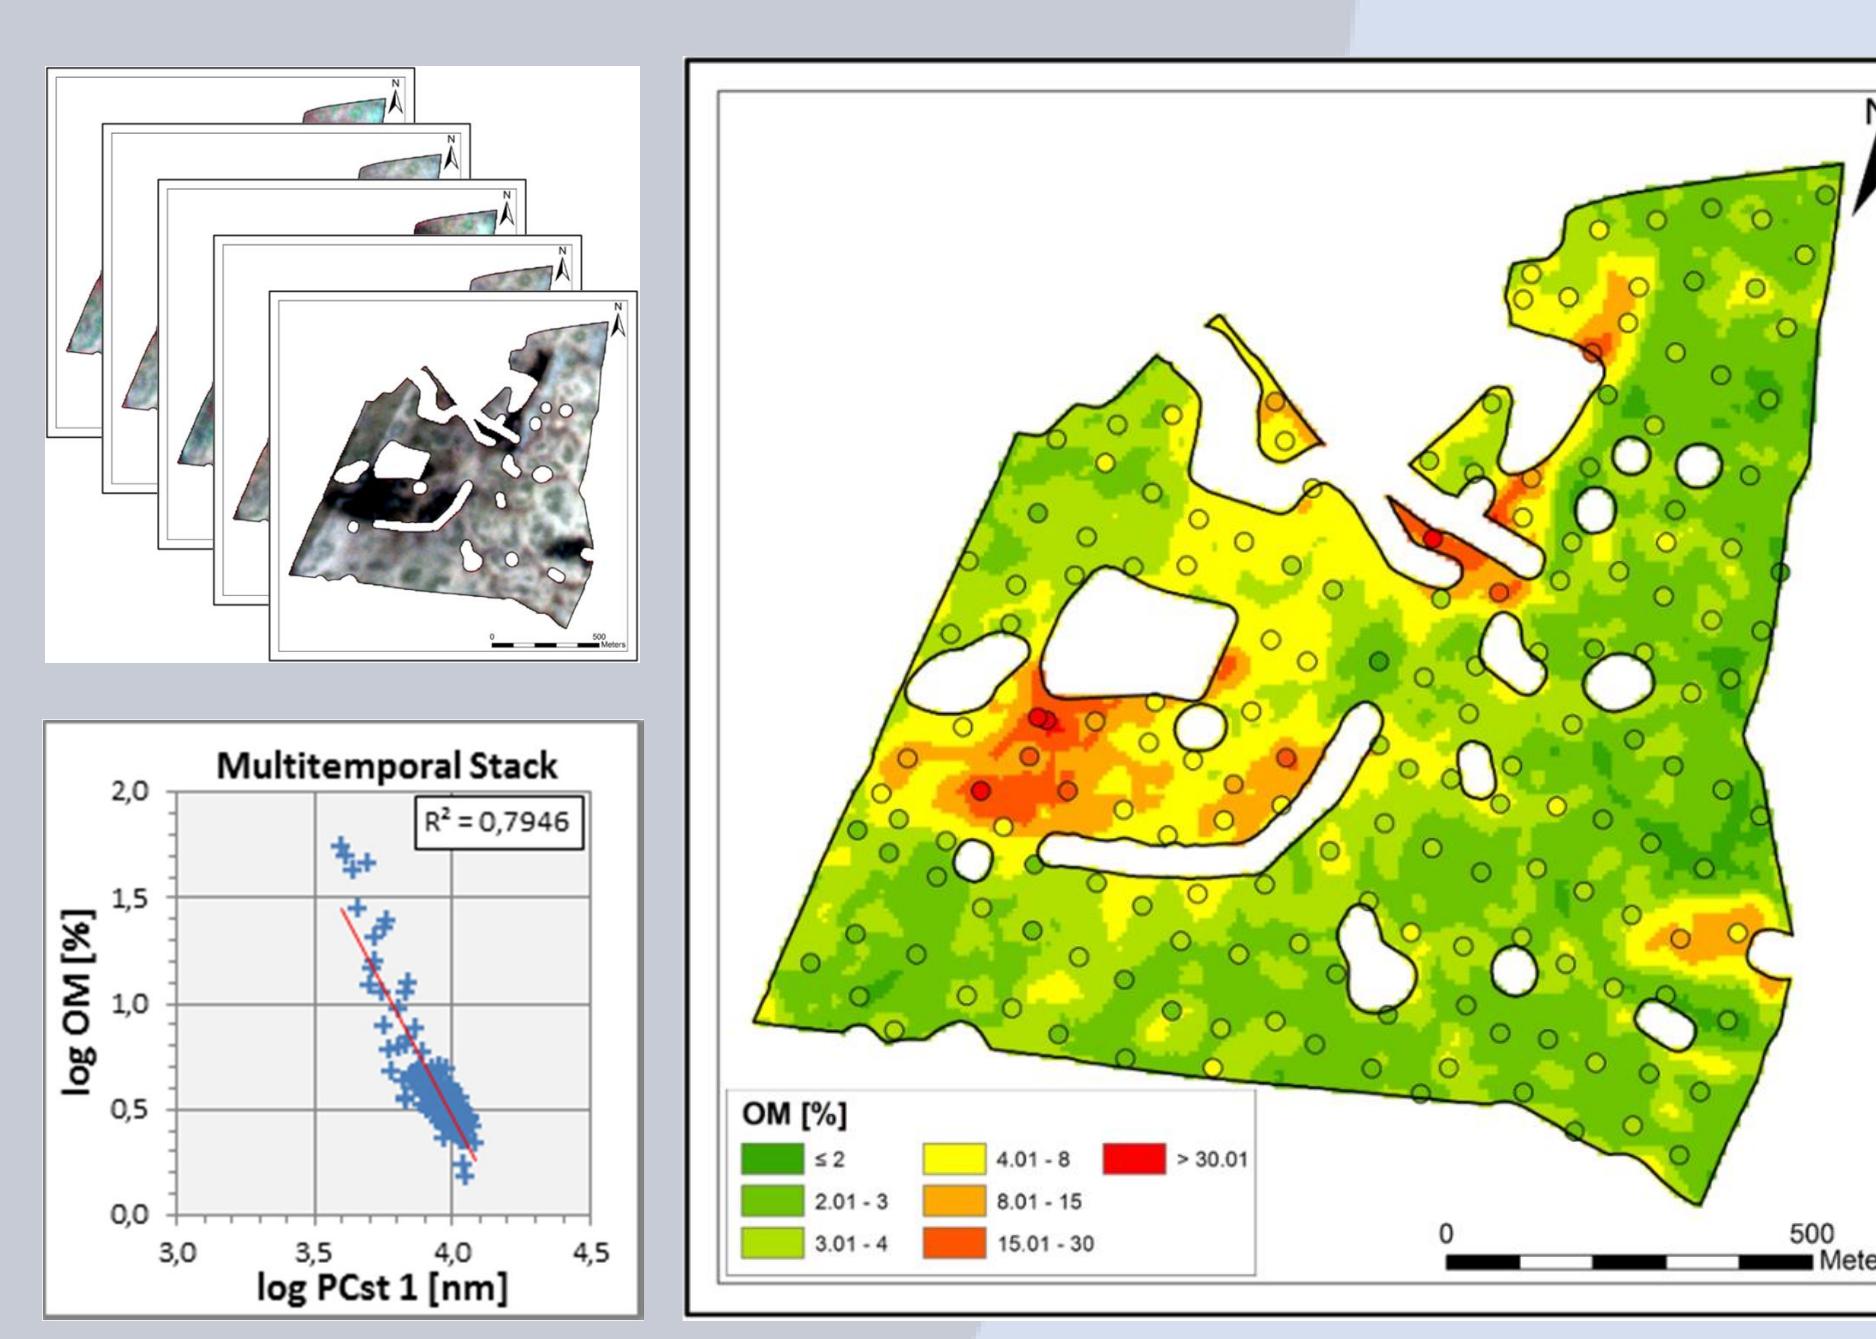

Determination of Crop Parameter

- Determination of Leaf Area Index based on Water Cloud Models (VV/VH)
- Sentinel-1 data of 2015

Determination of Soil Parameter

- Determination of surface soil organic matter content
- Multitemporal multispectral data (e.g. RapidEye, Landsat, Sentinel-2,)

Determination of Crop Parameter

- Progressive crop type classification
- Based on multitemporal multispectral data (e.g. RapidEye, Landsat, Sentinel-2,)
