Porous flap trailing edges for the reduction of jet-flap interaction noise

- Problem definition
 - Geometry
 - Aerodynamics
 - Acoustics
 - Porous noise reduction technologies
- What is jet-flap interaction?

Warren East (CEO Rolls Royce, 01/2021): "We [will] fully test our [Ultra-Fan] demonstrator. At that point we will put the thing on ice. I can't force airframe manufacturers to invent new aeroplanes and if there is no demand for them then there is no demand for engines."

JFI effect vs. noise reduction (for different jet Mach number)

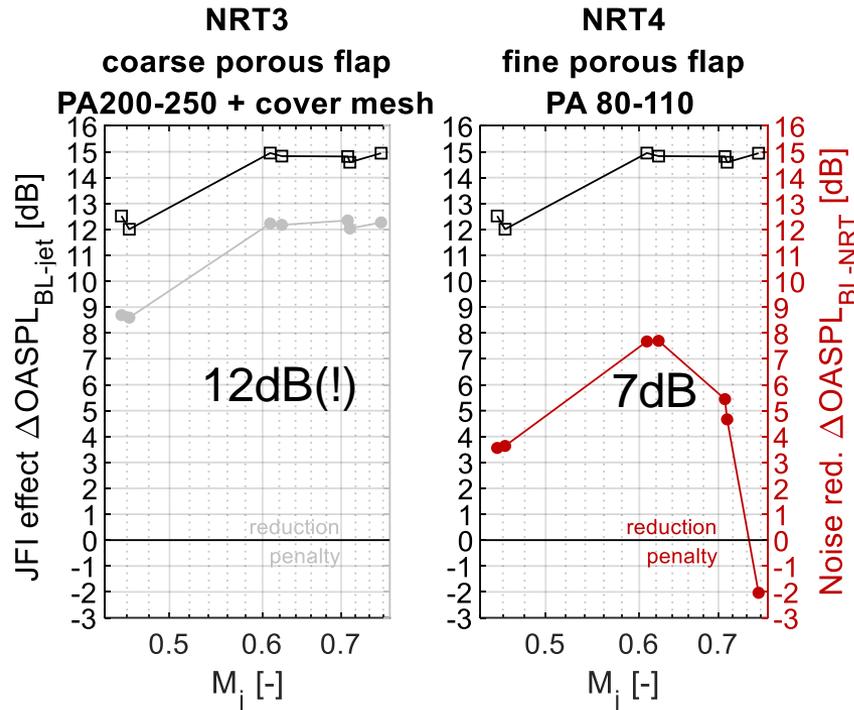

JFI effect increases with jet speed
NRT4 performs optimally upto / at $M_j=0.62$

JFI effect vs. noise reduction (for different jet Mach number)

JFI effect increases with jet speed

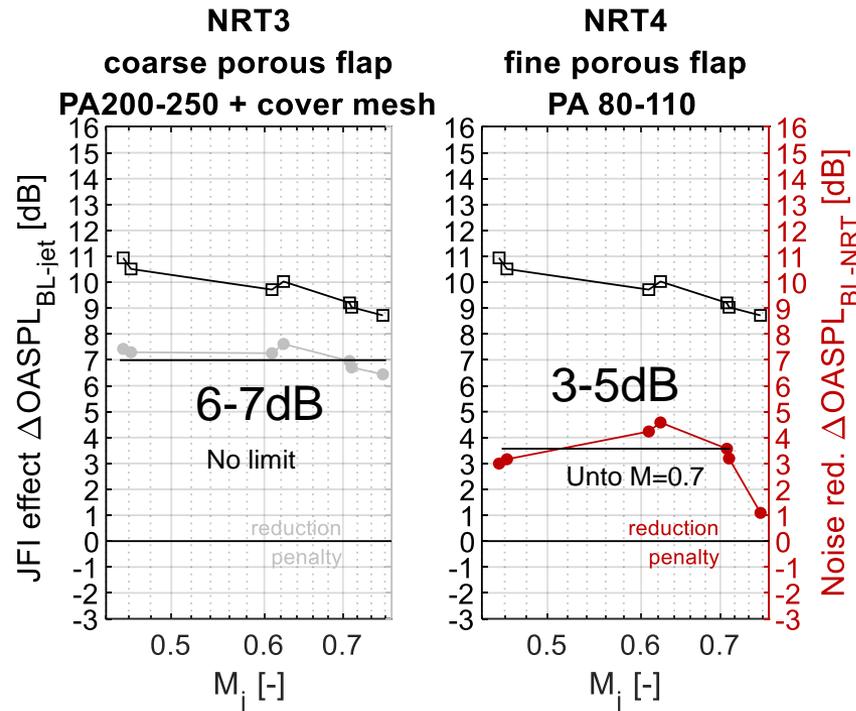

NRT4 performs optimally upto / at $M_j=0.62$

NRT3 performs extraordinarily well (tones reduced to zero)

Broadband-like JFI effect + noise reduction (tones removed)

Broadband part of JFI effect decreases with jet speed (!)

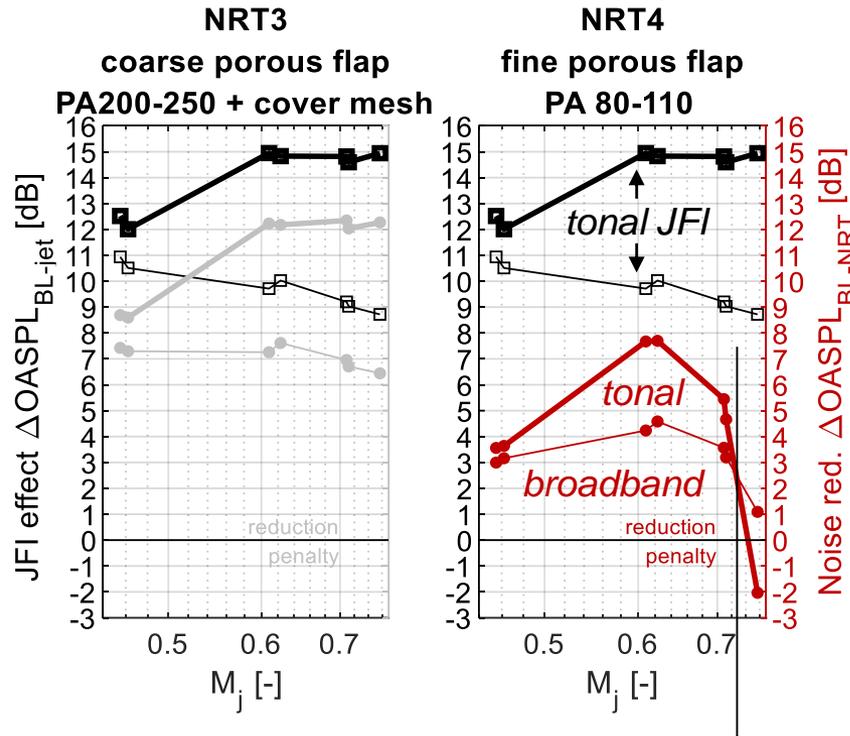

Static jet speed effect on JFI noise

close engine integration ($L/D_j=2$, $H/D_j=0.6$)

Evaluation

— thick: w/ tones
— thin: tones removed

What happens here?

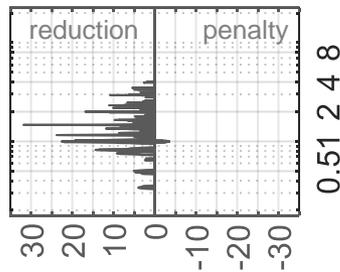

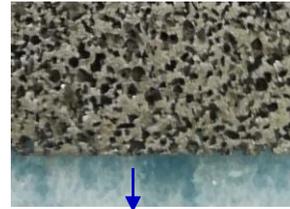

Why performance drop near $M_j=0.75$?

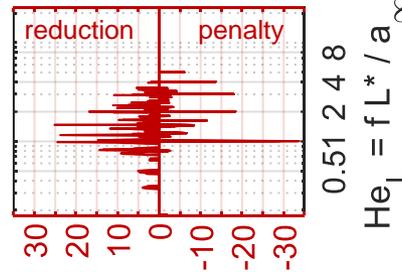

NRT3 Noise red.
 $\Delta\text{SPL}_{\text{BL-NRT}}$ [dB]

NRT4 Noise red.
 $\Delta\text{SPL}_{\text{BL-NRT}}$ [dB]

Irregular along TE „line“, thinnest

$n=1\dots 5$

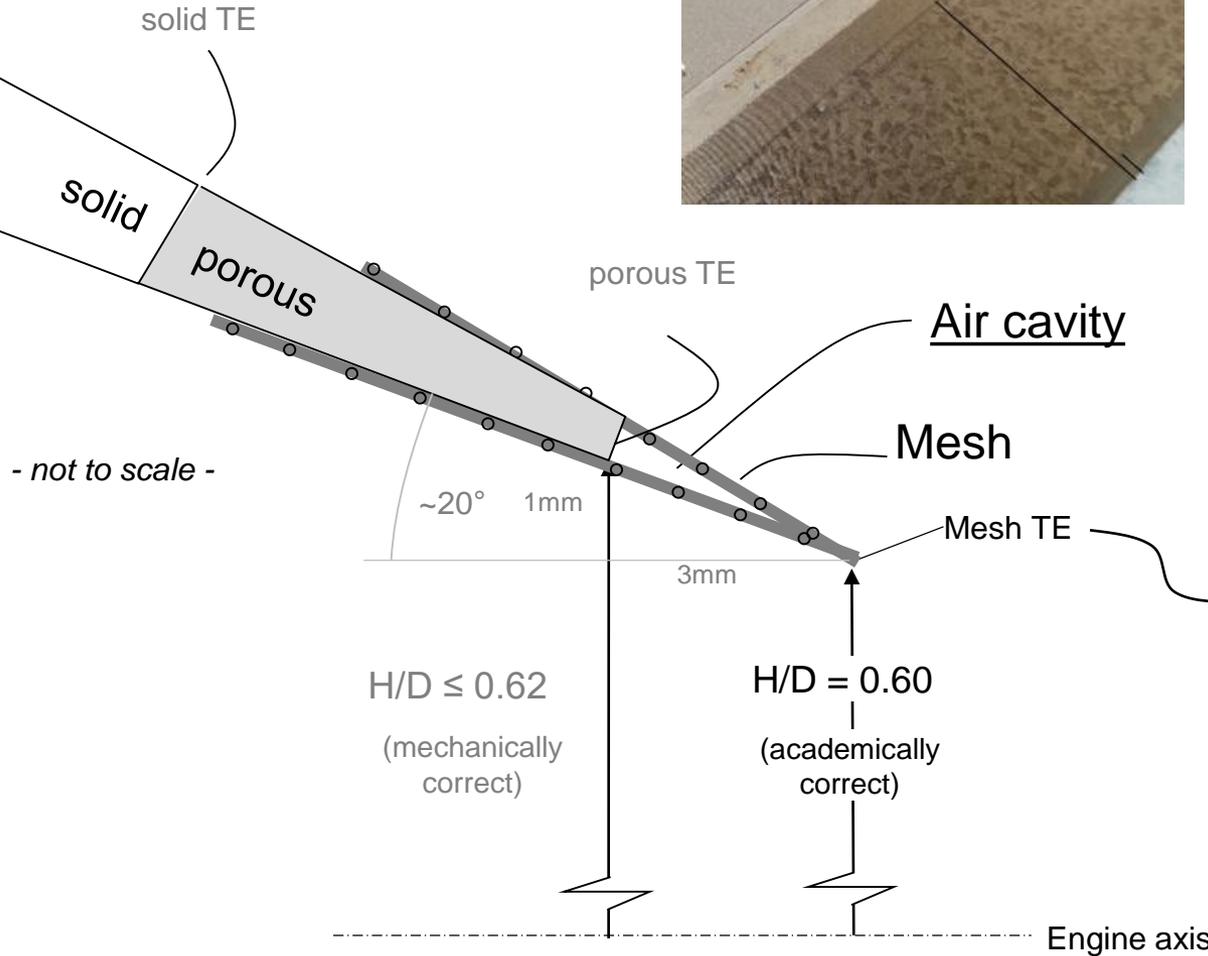

No tones!

Trailing edge tones!

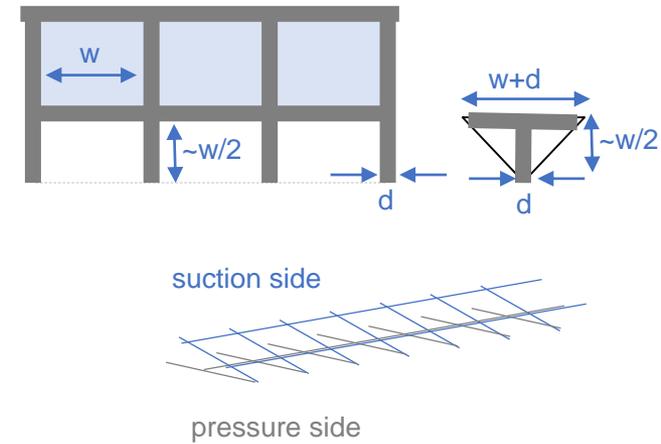

What is so special about NRT3?

micro-serration-like structure

Summary: flow permeable materials for jet-flap interaction noise

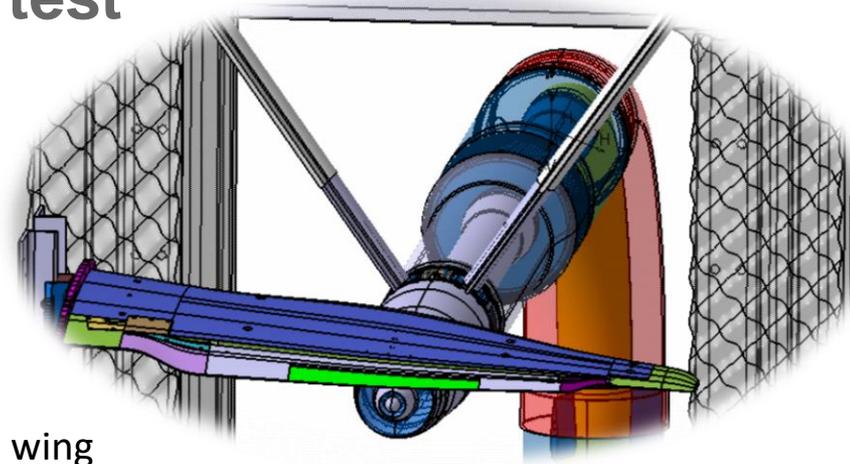

- Porous flaps help decrease broadband and tonal components of JFI noise
- Noise reduction is 6-7dB (conservative, tones removed) and can reach up to 10-12dB (tones not removed)
- influence of the cover mesh plays a significant role
 - It encloses a very permeable cavity between porous trailing edge and mesh trailing edge, and
 - forms micro-serrations-like structure at the very thin mesh trailing edge
- experimenting with cover meshes (possibly even on solid surfaces) is advised

DJINN Challenges for the WP3 test

- Show for the first time that manufacturing of complex 3D porous flap geometry is possible
- Show NRT potential at mid scale experiment (Safran engine vs. RDJ80 wing)
 - Cross compare noise reduction at static conditions (w/WP1 experiment)
 - Observe for the first time JFI noise reduction of porous materials at flight conditions
