

# VRU SIMULATOR VALIDITY ASPECTS

2nd HCVRU Sim Workshop, 22.2.2023

Martin Fischer et al.

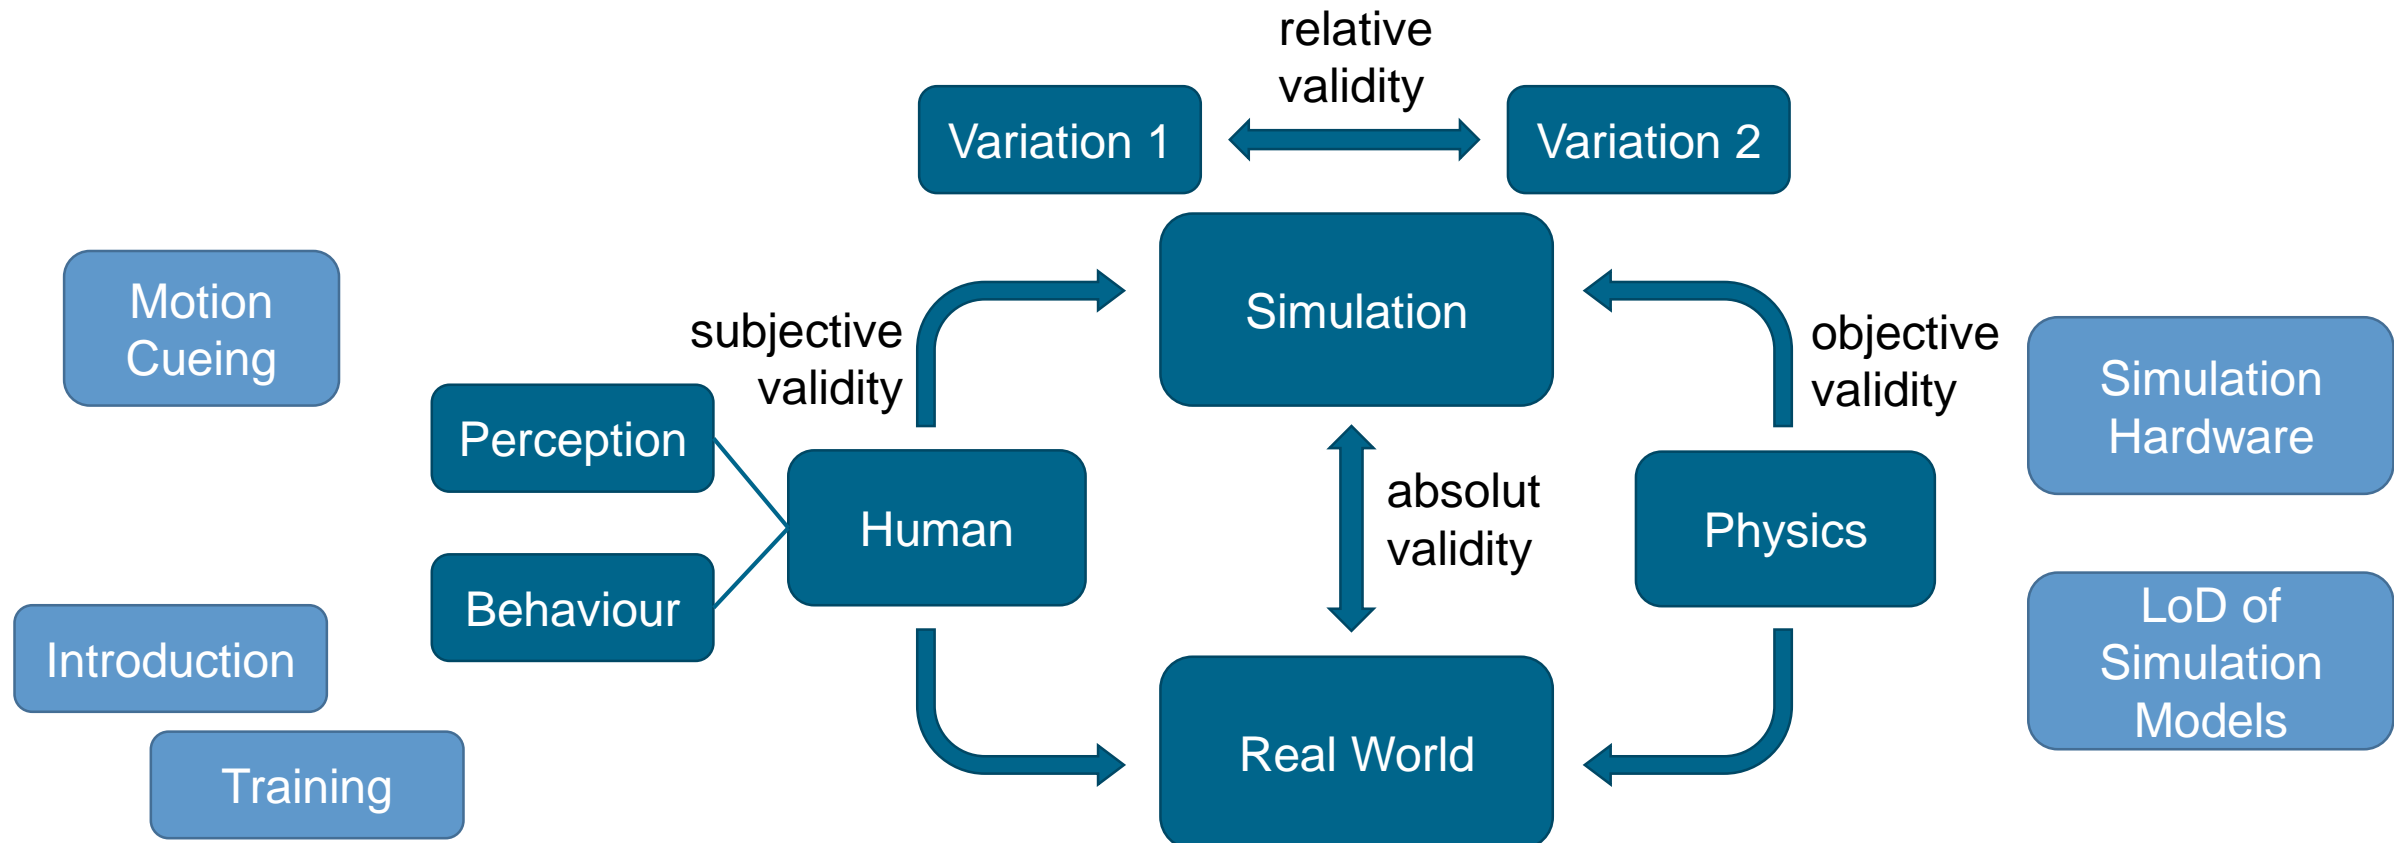

# SIMULATION VALIDATION

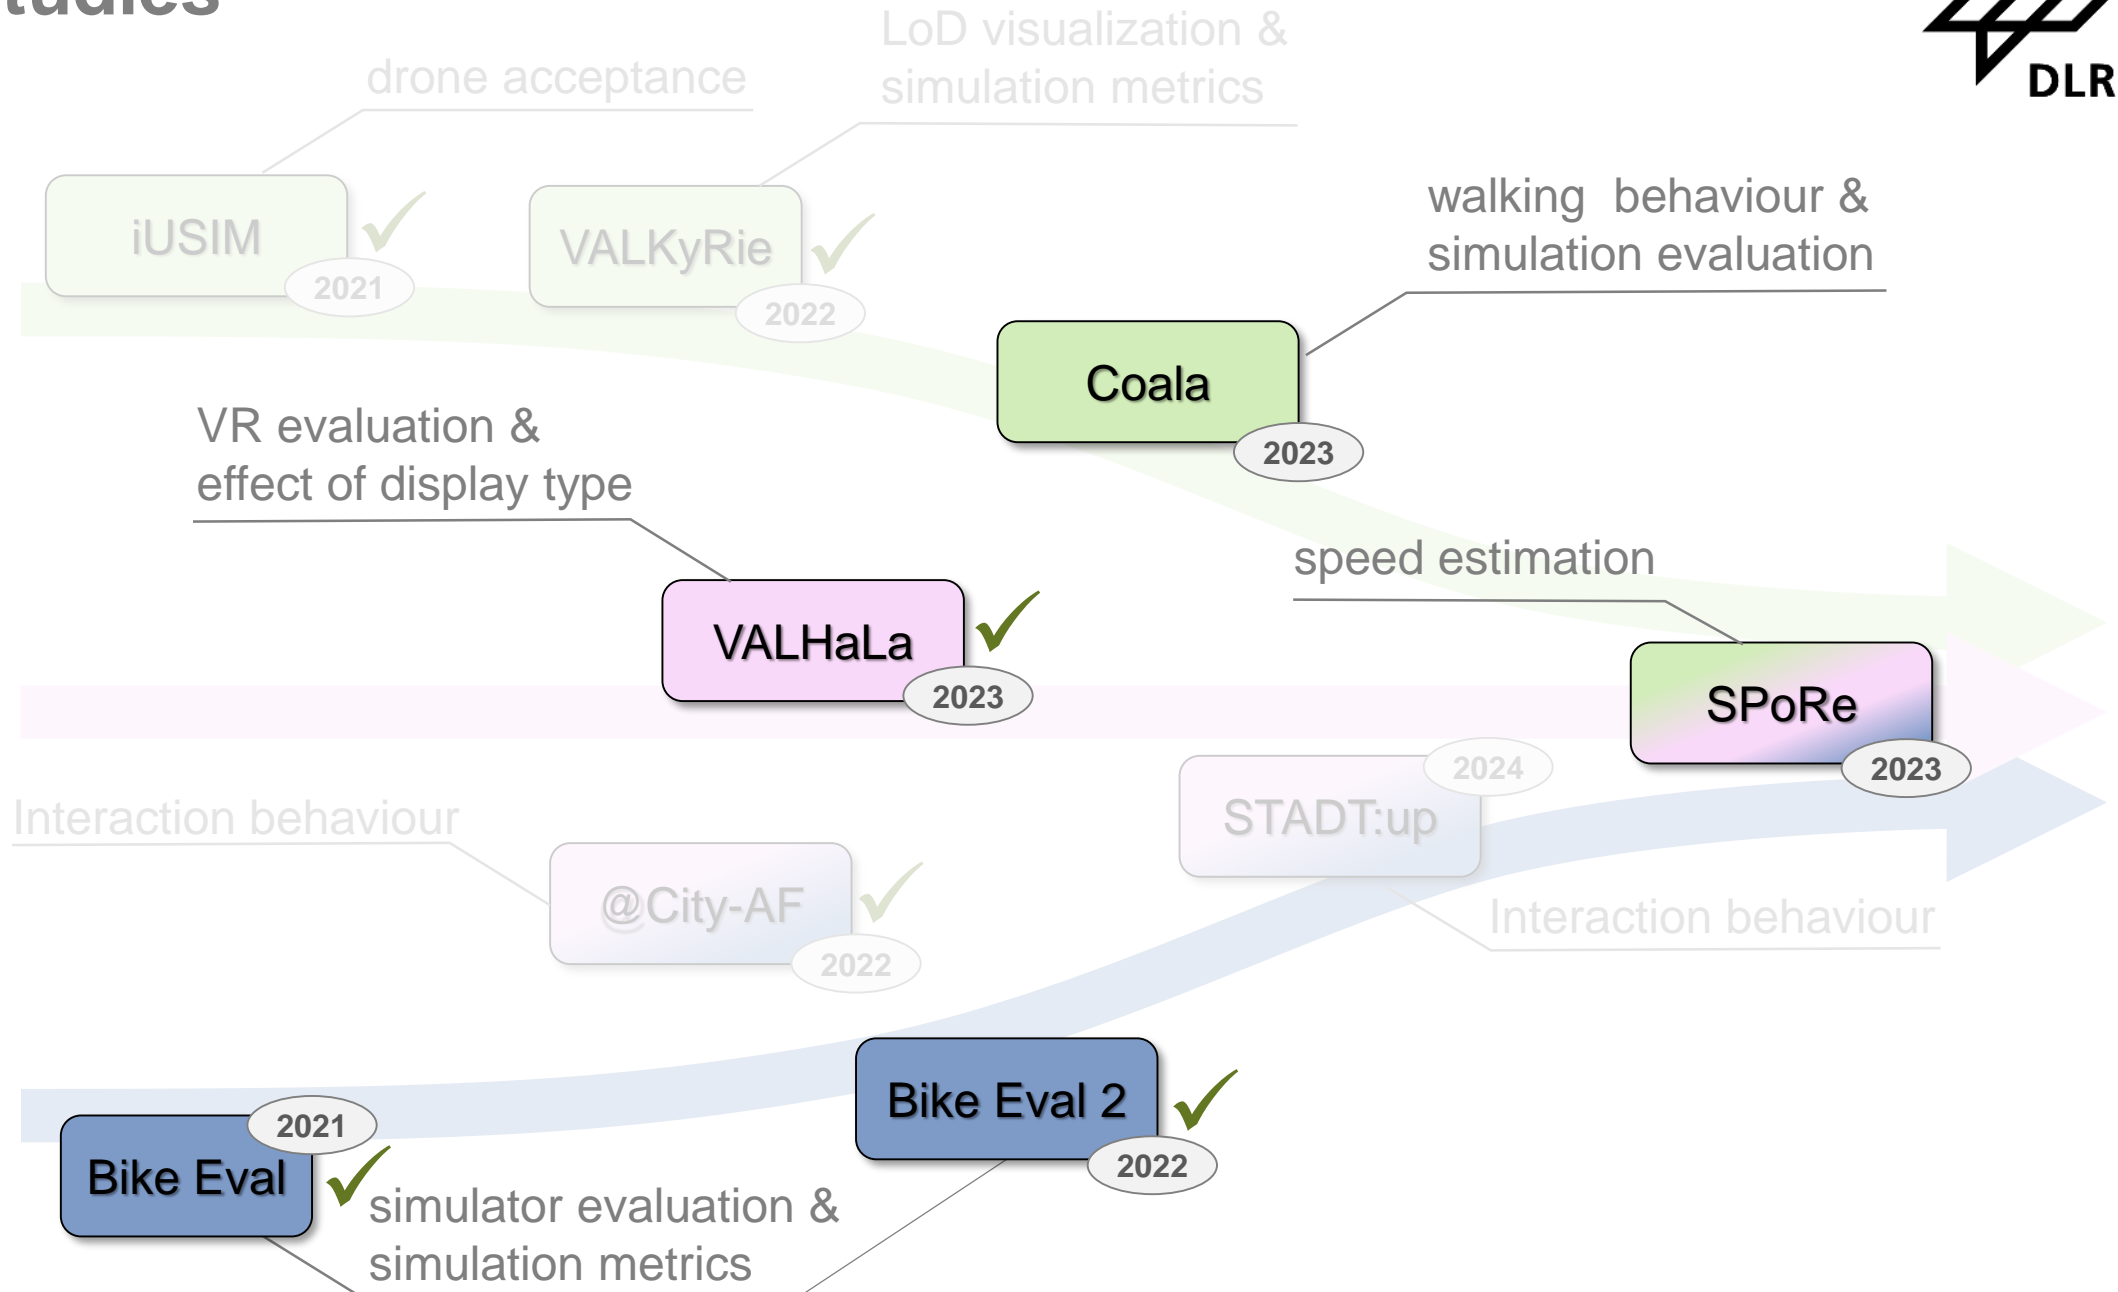

# Motivation for Validation

- Reliability – Transfer of simulator study results to real world applications
- Containment – Knowing the limits of the simulator environment

# VRU studies

# TRAINING

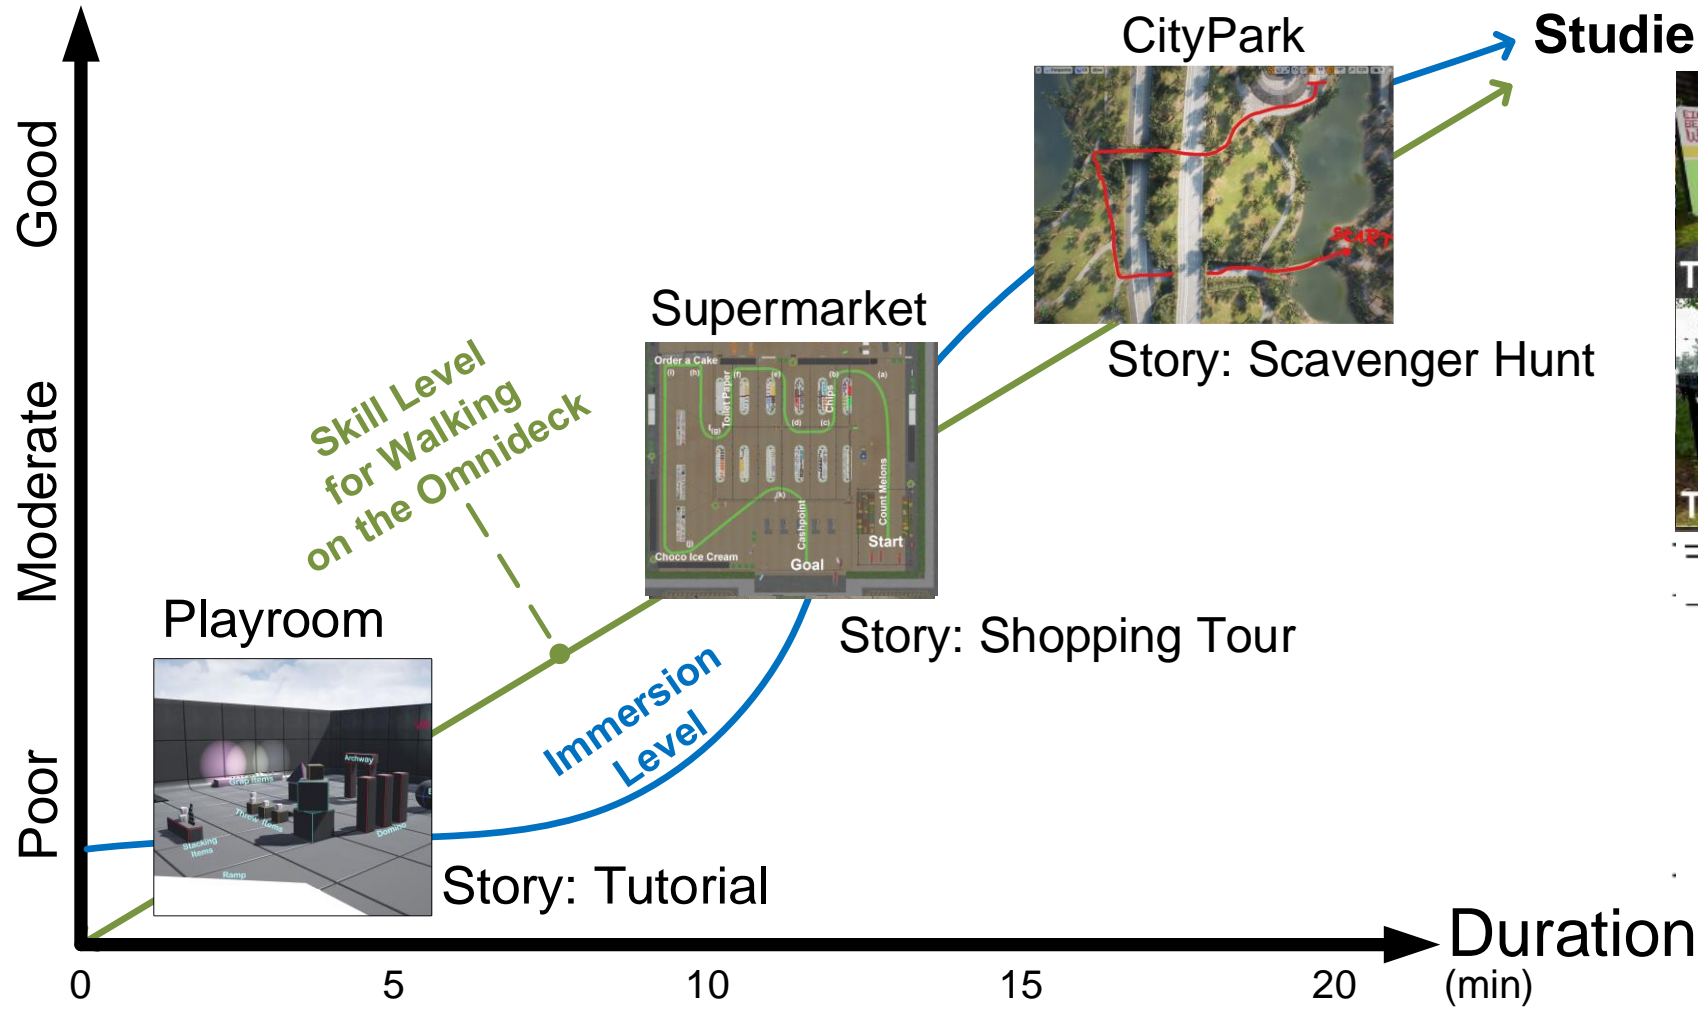

# Training Scenarios Overview

Immersion / Skill level

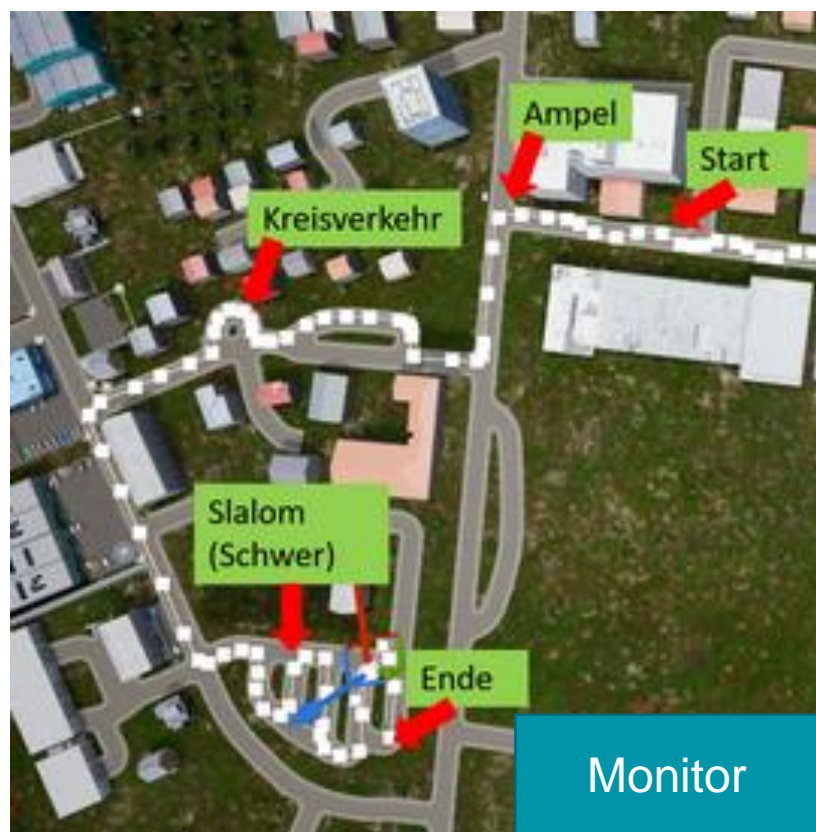

No.	Task description:
1	Starting point with instructions to read
2	Solve a riddle to choose between two directions
3	Keep environment clean. Dispose some single use coffee cups
4	Cross less traveled street by interacting with a call-by-demand pedestrian traffic light
5	Take a short rest and drink a cola can
6	Scare some crows and make them fly out of the way
7	Climb a longer staircase up
...	

# Cyclist Training Scenarios

T1) Cyclist should become familiar with

- the **dynamics** of the bicycle when going straight, stopping, braking, accelerating and turning
- the **sensitivity** of the handlebars, the brake and motion platform

T2) Cyclist should become familiar with

- **moving around** in VR

# PERCEPTION

# VALHaLa Pre-Study on display effects

- How good (depending on distance & size) are traffic signs readable?
- Two different variants of display type analysed:

HTC Vive Pro Eye

Triple Display set-up

Real world

- Task 1: Moving forward. Press button when traffic sign is readable
- Task 2: Static. Scale size of traffic sign (at a fixed distance) until it is just readable

# VALHaLa Pre-Study on display effects

Distance to traffic sign (m)

Real world measurements

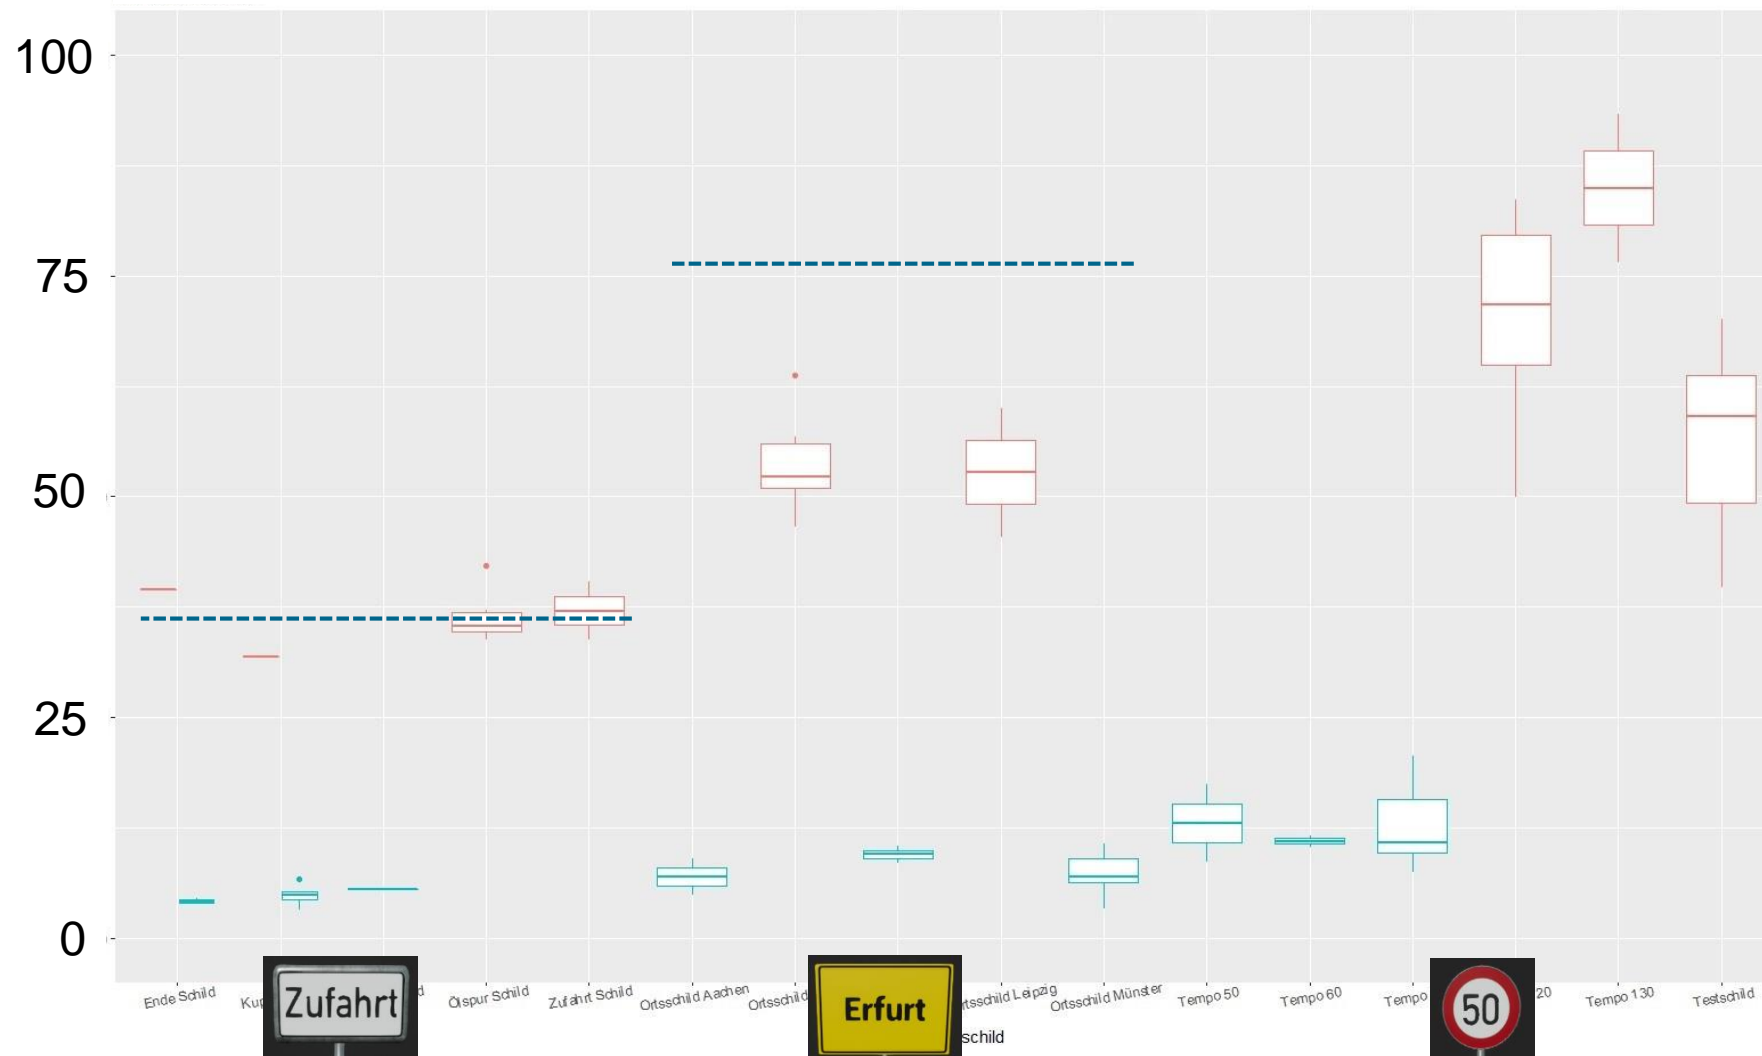

# VALHaLa Pre-Study on display effects

Distance to traffic sign (m)

Real world measurements

Simulation results

Triple Display set-up

HTC Vive Pro Eye

# VALHaLa Pre-Study on display effects

Scaling factor (-)

Real world reference

Simulation results

Triple Display set-up

HTC Vive Pro Eye

A person is seen from behind, wearing a VR headset and gloves, riding a stationary bike in a virtual reality environment. The large screen in front of them displays a 3D-rendered street scene with a pedestrian crossing, a traffic light, and a person walking. The room is dimly lit with blue ambient lighting.

# BIKESIM EVALUATION & VALIDATION

# Bike Simulator Evaluation

Bike Eval 1	
BikeSim V1.1 Profile B	BikeSim V1.1 Profile A

## Bike Eval 2

Feature	BikeSim V1.1 Profile A	BikeSim V2.0 Adapted lateral and longitudinal dynamics (force feedback & haptics)
① Steer	Steering force feedback based on look-up table with <b>adapted vehicle dynamics steering forces</b>	Steering force feedback based on <b>bike physics model</b>
② Lean	<b>Force control</b>	<b>Position control</b> (model based approach)
③ Accelerate	<b>Force trainer</b>	<b>Speed sensor</b> rotary controller → high resolution, low latency
④ Brake	<b>Disc brake</b> at the flywheel + <b>Force trainer information</b>	<b>Disc brake</b> at the flywheel + <b>Speed sensor information</b>
⑤ Headwind	<b>Static</b> headwind	<b>Dynamic</b> headwind control based on driving speed

### Bike Eval 1

# Szenarios

**A** – Stop at traffic light + drive around construction site

**B** – Slalom

**C** – 90° turns at intersection

**D** – Interaction with pedestrian

**E** – Overtaking an e-scooter

**F** – Turning head

## Results – Overall subjective feedback

- Overall feedback (at the end) more depending on order
  - 2nd was rated better

- Conclusion
  - Next study with „inbetween“ instead of „within“ study design  
→ each person drives only one set-up

# Results – longitudinal dynamics

- Overall improvement of longitudinal dynamics was successful

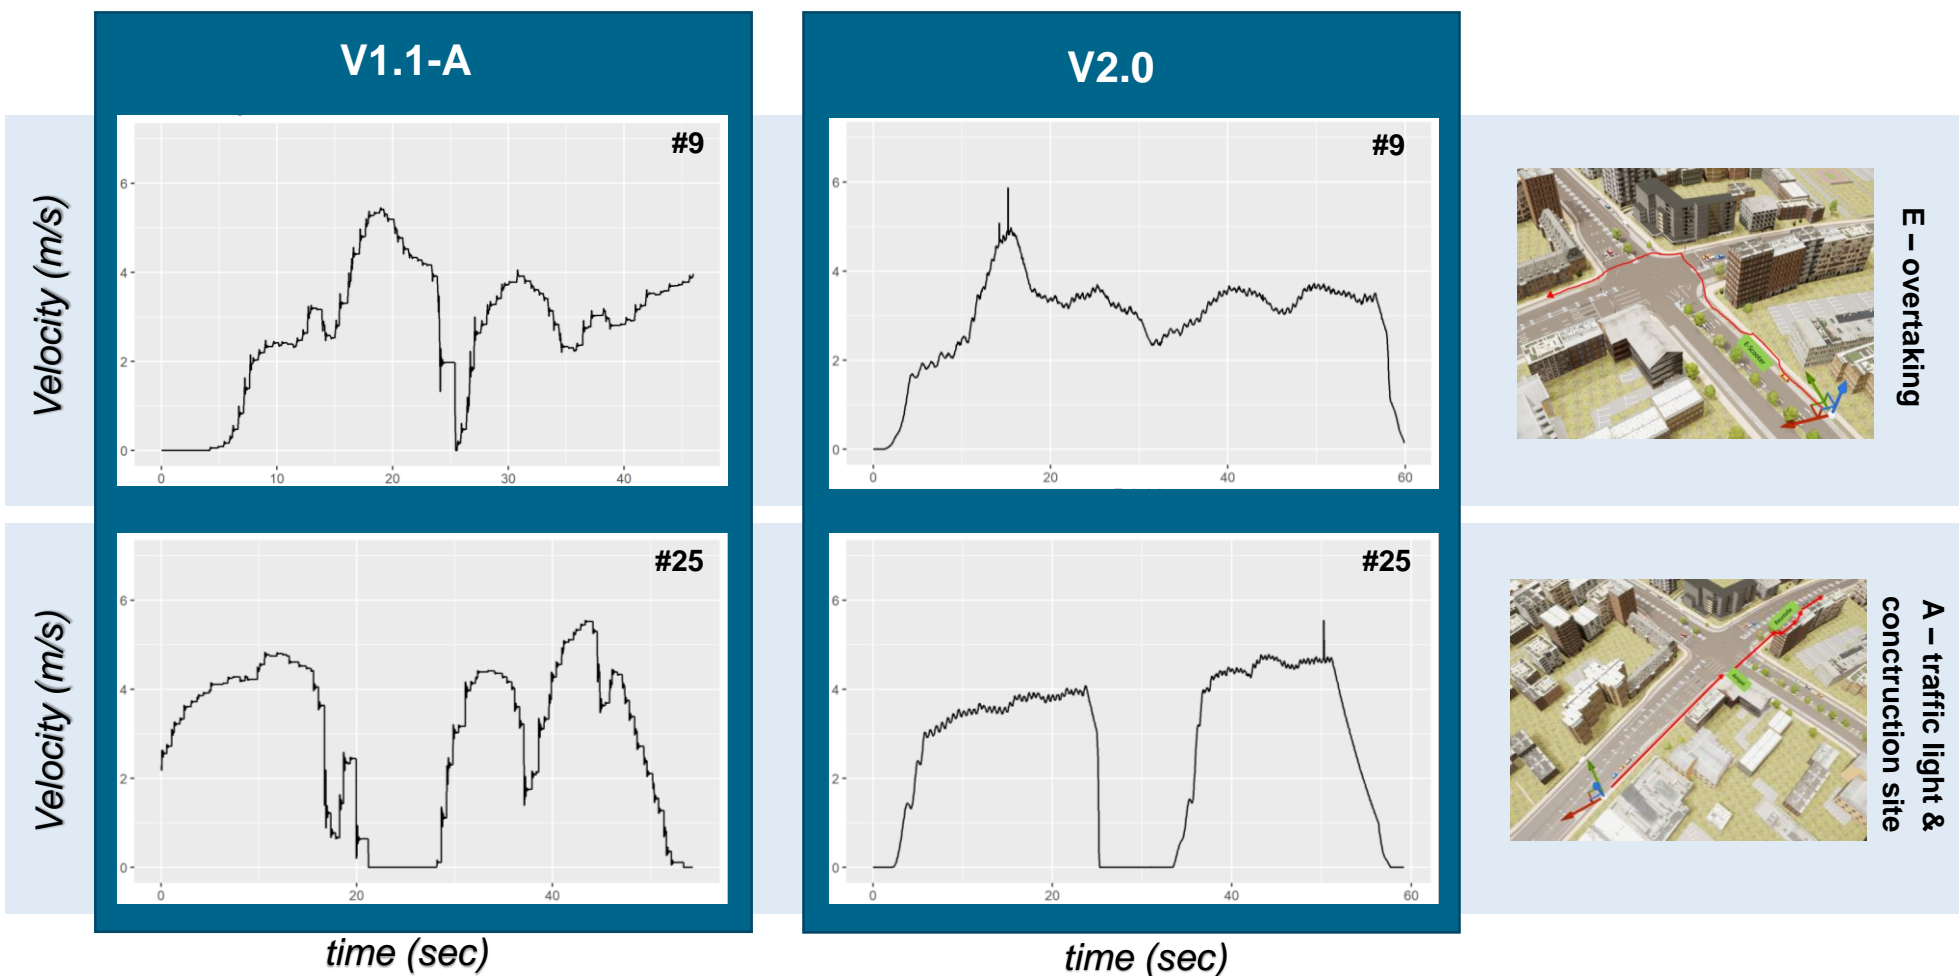

# Results – Driving Velocity

- More steady velocity with V2.0

# Results – Steering angle

- Different force feedback does not seem to have an influence

V1.1-A

Density

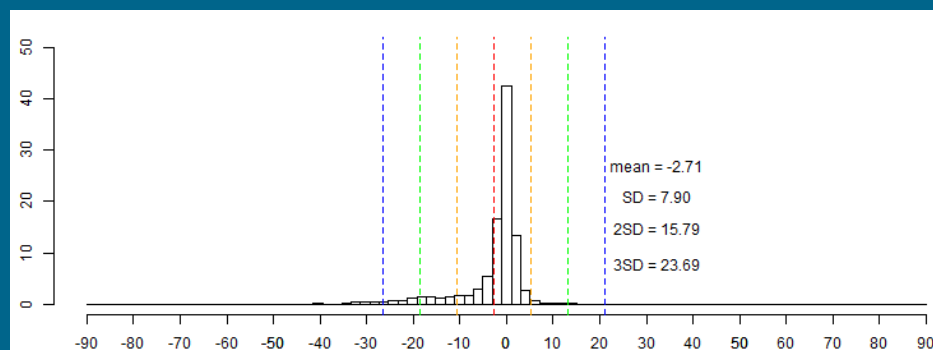

V2.0

B - slalom

Density

C - turning

Steer Angle (deg)

Steer Angle (deg)

## Results – Steering angle

- Some indication of better controllability with V 2.0

V1.1-A

V2.0

D - Interaction

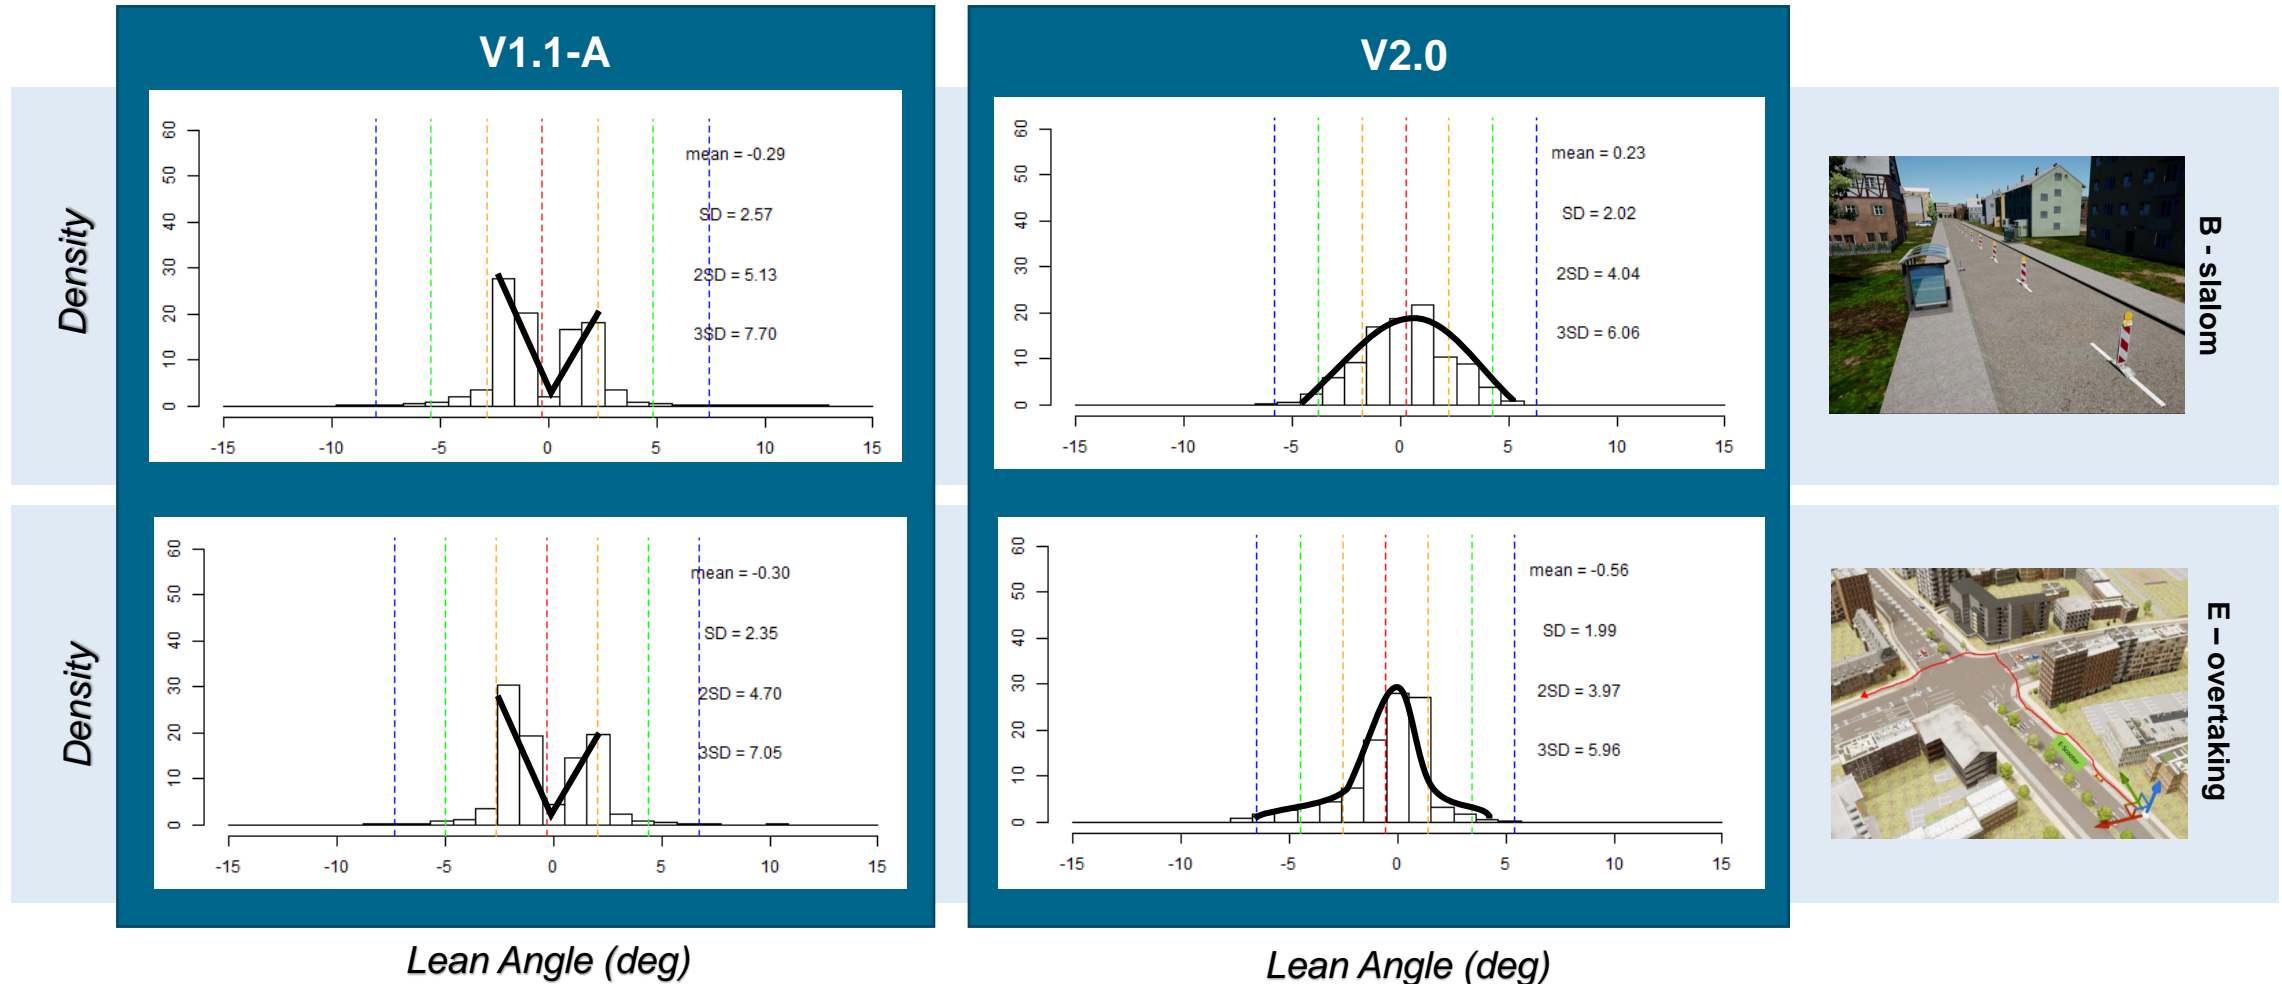

# Results – Lean angle

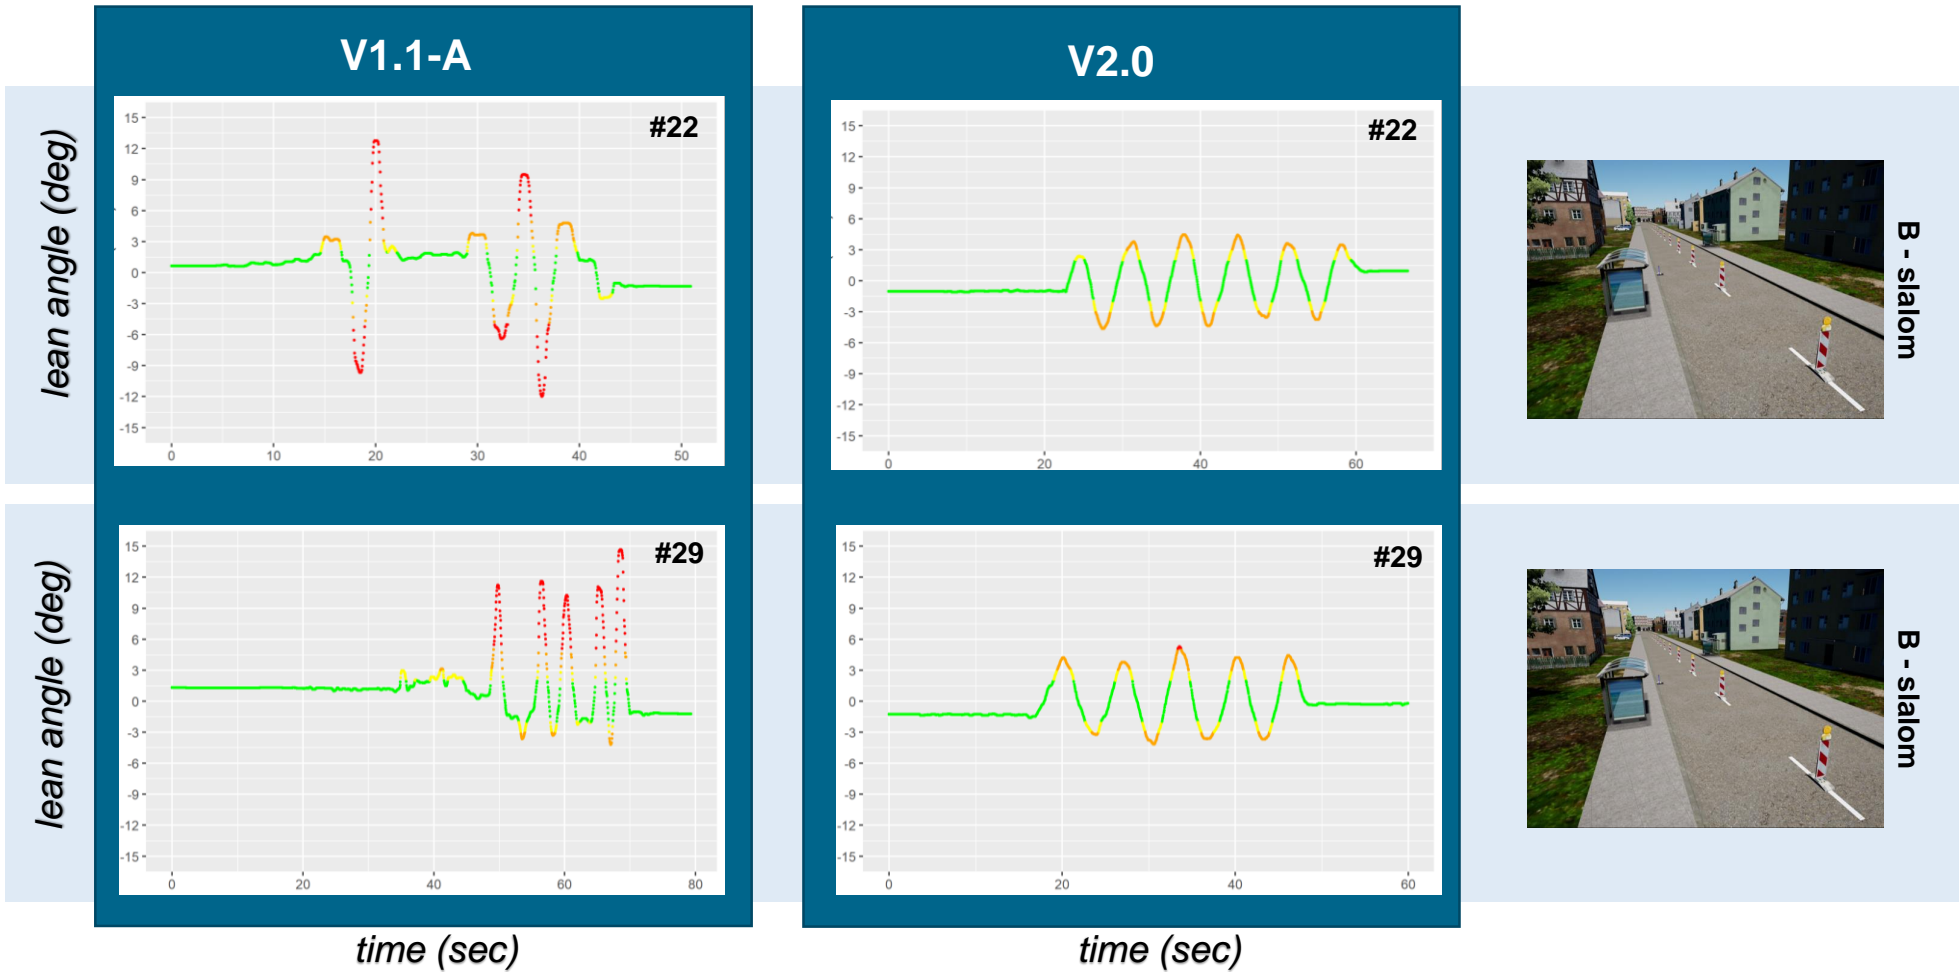

- Clear difference between profiles. More steady distribution with V2.0

# Results – Lean angle

- More steady driving behaviour with V2.0

# Results – Lean angle

V1.1-A

V2.0

E – overtaking

Training 1

Monitor

# OUTLOOK

# Bike Evaluation – Next Steps

## ■ Validation

- Real world bicycle driving at the AIM research intersection with the BoReal Bike „BoBBi“

- Similar scenarios

- Comparison of BikeEval 2 data to real world data

- Lean angles
- Steering angles
- Velocities
- Accelerations

- Further Improvement of lateral dynamics

Bike Eval 2

SaveNow

# SPoRe – Speed Perception of Road Users

- Goal: Evaluate perceived vs. real speed

*line*

*Separation  
massive barrier*

*grass strip*

Figure 09 – Download: Playze

# Study „VALHaLa“ ongoing

## Goals

- Investigation of **influence of the display form** (monitor vs VR glasses) used on driving behavior in the simulator
- In particular, the influence on **simulator sickness, presence and objective driving data** shall be analysed

HTC Vive Pro Eye

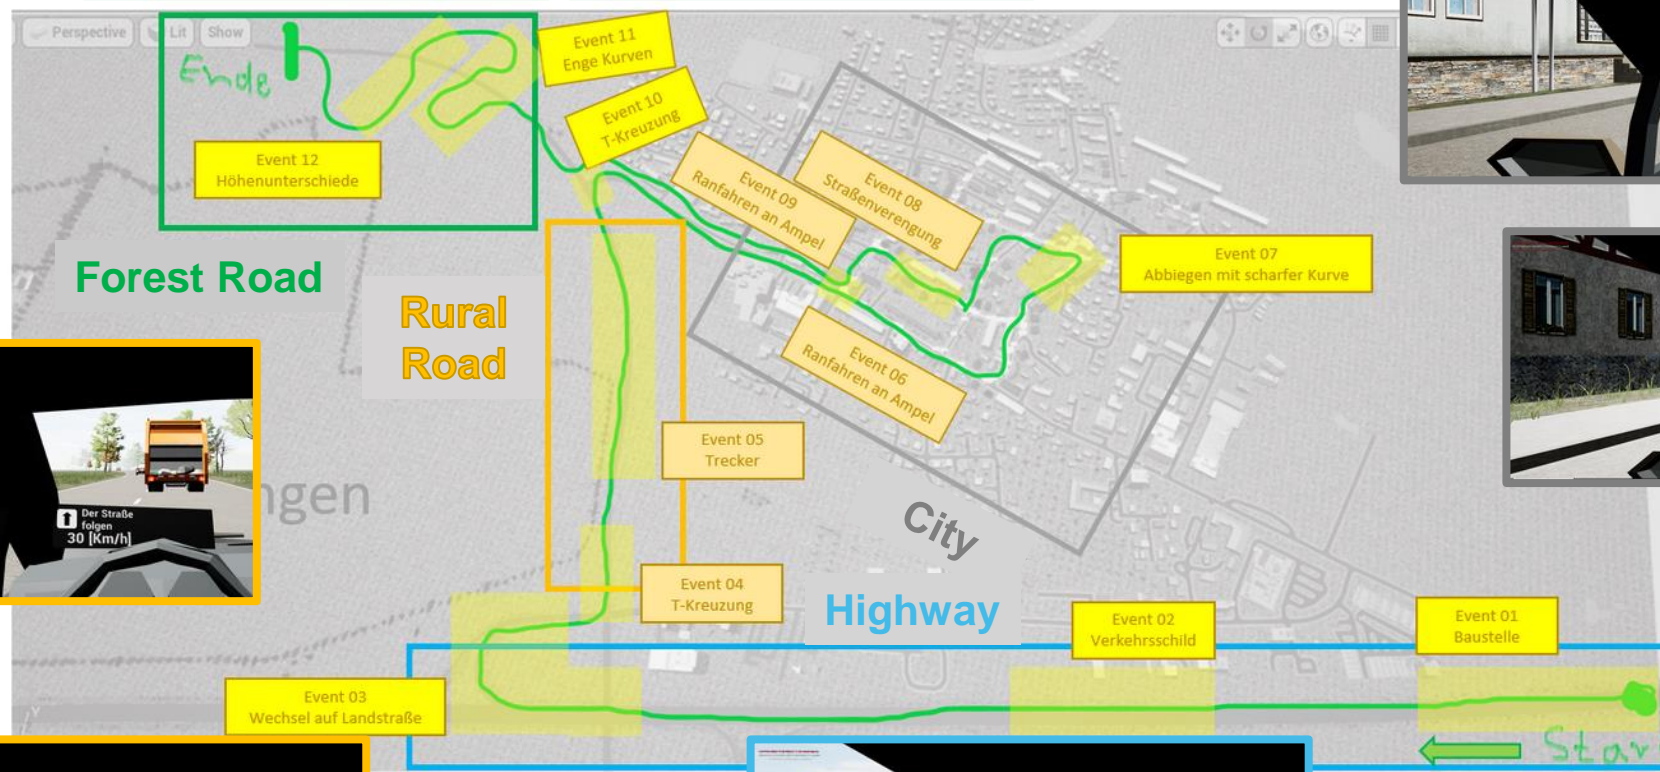

XTAL 8K

Triple Display set-up

# Study „VALHaLa“

# Study „Coala“ (planned for 2023)

## Means of Virtual Walking

Controller

Cyber Shoes

Walk in place

Treadmill

Free walking
