

Benthic Habitats and how to find them with Google Earth Engine

Spyridon Christofilakos, German Aerospace Center (DLR)

Benthic Habitats

Benthos is the community of organisms that live on, in, or near the sediment at the bottom of water bodies. Numerous species of bacteria, algae, and protozoa are part of the microscopic benthos.

Benthic Habitats

Seagrass meadows are among the most productive habitats in the coastal zone, performing essential ecosystem functions such as:

- water oxygenation and nutrient provision,
- seafloor and beach erosion stabilization
- nursery areas and refuge for commercial and endemic species
- carbon deposition and sequestration (blue carbon)
