Abstract—TerraSAR-X is Germany’s first national remote sensing satellite being implemented in a public-private partnership between the German Aerospace Centre (DLR) and EADS Astrium GmbH. TerraSAR-X was launched on June 15th, 2007 and will supply high-quality radar data for purposes of scientific observation of the Earth for a period of at least five years. At the same time it is designed to satisfy the steadily growing demand of the private sector for remote sensing data in the commercial market [1].

Index Terms — TerraSAR-X, radar, satellite, launch and early orbit phase, commissioning phase, system potential

I. INTRODUCTION

The TerraSAR-X features an advanced high-resolution X-Band Synthetic Aperture Radar based on the active phased array technology which allows the operation in Spotlight-, Stripmap- and ScanSAR Mode with various polarizations. It combines the ability to acquire high resolution images for detailed analysis as well as wide swath images for overview applications. In addition, experimental modes like the Dual Receive Antenna Mode allow for full-polarimetric imaging as well as along track interferometry, i.e. moving target identification.

II. THE TERRASAR-X SATELLITE

The TerraSAR-X satellite bus is a heritage from the successful Champ and Grace missions. The TerraSAR-X features an advanced high-resolution X-Band Synthetic Aperture Radar based on the active phased array technology which allows the operation in Spotlight-, Stripmap- and ScanSAR mode with two polarizations in various combinations.

It combines the ability to acquire high resolution images for detailed analysis as well as wide swath images for overview applications. The experimental Dual Receive Antenna (DRA) Mode allows to independently receive the echoes from the two azimuth antenna halves. This new experimental mode enables the use of interesting new features like Along Track Interferometry, full polarimetric data acquisition and the enhancement of the stripmap azimuth resolution.

Figure 1 - Artist's view of TerraSAR

TerraSAR-X at a glance:	
Height:	4.88 m
Width:	2.4 m
Launch Mass:	1.230 kg (including payload mass 400 kg)
Orbit:	514 km
Inclination:	97.4°, sun-synchronous
Launcher:	Dnepr 1 (former SS-18)
Launch:	15 June 2007, 4:14 h (CEST) from Baikonur, Kazakhstan
Life time:	5 years
Radar Frequency:	9.65 GHz
Transmit Bandwidth	5 ... 150 MHz nominal 300 MHz experimental
Polarization:	HH / VV / HV / VH
StripMap Mode: [Range × Azimuth]	Resolution: 3 m × 3 m Scene Size: 30 km × 50 km
SpotLight Mode: [Range × Azimuth]	Resolution: 1 m × 1.5 m...3.5 m Scene Size: 10 km × 5 km...10 km
ScanSAR Mode: [Range × Azimuth]	Resolution: 16 m × 16 m Scene Size: 100 km × 150 km

Table 1 – TerraSAR-X system parameters.

III. THE TERRASAR-X GROUND SEGMENT

The TerraSAR-X Ground Segment is provided by DLR and constitutes the central element for controlling and operating the TerraSAR-X satellite, for calibrating its SAR instrument, and for archiving the SAR data as well as generating and distributing the basic data products [2].

The DLR Ground Segment is based on existing national infrastructure as much as possible and will be optimized for flexible response to (scientific and commercial) user requests and fast image product turn-around times. It is composed of three major elements:

- The Mission Operations Segment (MOS) provided by the German Space Operation Center (GSOC).
- The Payload Ground Segment (PGS) provided by the German Remote Sensing Data Center (DFD) and the DLR Remote Sensing Technology Institute (IMF).
- The Instrument Operation and Calibration Segment (IOCS) provided by the Microwaves and Radar Institute (IHR).

IV. SCIENTIFIC COORDINATION AND COMMERCIAL EXPLOITATION

- The scientific exploitation of the TerraSAR-X data will be coordinated by DLR, which is the point of contact for all science users.
- Commercial customers, on the other hand, will have to contact Infoterra for access to TerraSAR-X data via the commercial TerraSAR-X Exploitation and Service Infrastructure (TSXX) developed by Infoterra. In addition to the baseline station in Neustrelitz, Infoterra will set up additional receiving stations for so-called Direct Access Customers (DAC) respectively Direct Access Partners (DAP). These so called Direct Access Stations (DAS) are foreseen to extend the baseline receiving station concept.

V. MISSION STATUS

A. Launch and Early Orbit Phase (LEOP)

TerraSAR-X was successfully launched on June 15th, 2007, 2:14 UTC on a Dnepr-1 in Baikonour, Kasachstan. During the LEOP the basic functionalities of the bus and the prime and secondary payload were checked out successfully:

- First acquisition 15 minutes after launch over ESA ground station in Malindi / Kenia
- Satellite and SAR instrument were operational and working well
- X-band data reception switched on at LEOP day 4
- SAR performance is excellent, the first image was processed at LEOP day 5 on June 19th, 2007
- 2-frequency GPS Receiver IGOR (secondary payload) of the German Research Centre for Geosciences (GFZ) is operational

- Check-out of the Laser Communication Terminal, LCT (secondary payload) completed. The first satellite-to-ground link was executed successfully.
- All standard imaging modes (strip, spot & scan) have been exercised.
- The Launch and Early Orbit Phase was successfully completed on June 21st, 2007. All activities planned were performed as scheduled.
- Reference orbit was reached on June 26th, 2007.

Only four days after launch the first SAR image was processed successfully. As shown in figure 1, a 30 km × 60 km area in Russia, western to Volgograd has been imaged in the stripmap mode, HH polarization. The resolution is ca. 15 m.

In the upper half of the image, the Tsimlyanskoye reservoir can be seen. Here the River Don is dammed with the water being used for power generation. In the upper right corner of the view, you can see a channel with a weir. In the immediate neighborhood the meandering oxbow river bends can be seen as dark surfaces. Calm water surfaces are typically very dark in radar photographs, since the radar radiation hitting them is reflected away. In the centre-left of the image, a railway bridge over the River Don can be seen with the railway line disappearing towards the northeast.

In the lower half, large, agricultural areas dominate. The fields form regular patterns, on which can be spotted meandering tributaries. The different brightness results from the differing vegetation and the particular stages of their annual growth cycles.

During this survey, a thick cloud cover prevailed. Nevertheless, radar satellites such as TerraSAR-X offer imaging capability even in case of cloudy skies and at night. However, exceptional strong precipitation events like heavy thunderstorms may influence even radar imaging. Such an event can be seen at the upper left part of the radar image as a bright "veil".

The successful processing of the first image demonstrated the functional capability of the satellite on one hand and the operability of the ground segment on the other hand. The entire processing chain including order input, scheduling, commanding, data acquisition, on ground data reception, SAR processing and archiving of the images has been verified. This result was also the consequence of a comprehensive pre-launch testing program including numerous space-to-ground-segment tests.

Figure 2 - First TerraSAR-X image, Tsimlyanskoye reservoir, taken 19 June 2007, 15:03:24 UTC

B. Commissioning Phase Baseline Tasks

The commissioning phase was started June 22nd, 2007, encompassing an ambitious program with respect to the following goals [3]:

- Orbit and attitude verification:
The orbit and attitude products were verified explicitly by using laser ranging. The attitude product verification is covered implicitly by the instrument pointing calibration. The manoeuvre planning based on the reference orbit concept ensures the satellite is kept within a ± 250 m orbit tube [4].
- Instrument Characterization/Verification
Focal points of the investigations were instrument temperature characterization and check of instrument configurations for basic modes as well as special settings for antenna pattern and pointing calibration [5] [6].
- Overall SAR system performance characterization:
The overall SAR system performance characterization comprises an initial characterization during the first cycles over scenes with one corner reflector in order to

verify the format of the quick look images, header and radar raw data. The correctness of the data take commanding was verified via raw data and point target analysis. The characterization was then extended to verify the consistency of imaged scenes with selected modes and beams via evaluation of the response of several corner reflectors [4][7].

- Calibration of the radar data:

The TerraSAR-X calibration comprises the

- geometric calibration,
- antenna pointing calibration,
- antenna model verification,
- relative radiometric calibration
- absolute radiometric calibration
- internal instrument calibration

To ensure the successful execution of the different calibration procedures, dedicated calibration campaigns were performed. A calibration field was established in the vicinity of Oberpfaffenhofen, Germany enclosing an area of 120 km \times 40 km. Calibration targets like corner reflectors, transponders and ground receivers were deployed at 30 positions. At the end more than 80 calibration campaigns with deployed reference targets and about 90 acquisitions across the Amazon rainforest were carried out and more than 1000 data takes were evaluated [8][9].

- Check-out of receiving station and processing system:

The check out of the reception and transcription systems and the SAR processing system was performed including all inputs, such as SAR and calibration raw data, SAR header data, orbit and attitude products, processor settings and auxiliary products comprising calibration data and instrument parameters.

- SAR product verification and release of the basic products:

SAR product verification comprising the archive product verification and the delivery product verification w.r.t. format, annotation and content.

- Check out of Direct Access Stations operated by Infoterra GmbH.

- Load tests including the commercial service segment:

Two dedicated load test campaigns were performed in order to simulate a realistic load for ordering, processing and delivery work flow [10]. A high number of requests as expected in the operational phase were generated including conflicting orders in order to test the mission planning system [11] and to detect hidden errors in the work flows.

- Interferometric processing:

The interferometric processing was based on the nominal L1b products only and was used in the SAR product verification context for complex data product format verification including binary annotation and for consistency checks with annotated processing parameters such as Doppler, timing, velocity "B" parameter, etc. Also the relative geolocation accuracy

was assessed and the relative orbit accuracy was derived. The phase preserving processing and product formatting were verified [12] [13].

- The operational interfaces were opened in early August 2007 between the TerraSAR-X ground segment provided by DLR and the TerraSAR-X Exploitation Infrastructure (TSXX) which is provided by Infoterra GmbH. The future product ordering and catalogue product ordering was enabled. Thus the commercial service segment was betimes included in the testing program in order to ensure a smooth start of the commercial business.

- SAR product verification:

The SAR product verification comprises the archive product verification and the delivery product verification. Amongst others the format, annotation and content are verified [14] [15]. After all the results of the commissioning phase are reflected in the updated basic product specification [16], including also improvements with respect to the initial version as for example the

- improvement in *absolute* radiometric accuracy from 1.1 dB to 0.6 dB
- improvement in *relative* radiometric accuracy from 0.68 dB to 0.31 dB
- improvement in spotlight mode (azimuth) resolution from 2.2 m to 1.7 m
- improvement in pixel localization accuracy from 2.0 m to 0.3 m in range and 0.53 m in azimuth
- improvements in side lobe ratio of ca. 4 dB. In order to improve the side lobe ratios the weighting function was adopted at the cost of an acceptable reduction of the slant range resolution of 9 % from 1.1 m to 1.2 m.

Finally the experimental high resolution spotlight (300 MHz) products were characterized and the respective order option was activated.

C. Investigating Further Potential of TerraSAR-X

Alongside to the regular schedule the potential of the TerraSAR-X system comprising both space and ground segment was investigated with respect to the following applications:

- Repeat pass interferometry [17],
- Persistent scatterer potential [18],
- Along track interferometry utilizing the aperture switching mode for traffic measurements [19],
- TOPSAR mode which is a new acquisition mode proposed by E. Attema (ESA-ESTEC) and F. Rocca (POLIMI) [20]. This mode aims at achieving the same coverage and resolution as ScanSAR, but with a nearly uniform SNR and DTAR [21]. It is going to be the operational mode for Sentinel-1. Interferometric Wide

Figure 3 – Image of Sydney Harbour Bridge: Multi-temporal overlay of three high resolution spotlight (300 MHz, VV pol.) images (red, green, blue) acquired from September to November 2007. The overlay is solely based on image annotation data and thus demonstrates the geometric accuracy of TerraSAR-X L1b products. Any color in the image depicts a temporal change of the reflectivity. Unchanged targets appear as grey image pixels [15].

Swath (IWS) mode. Meanwhile TOPSAR data takes were performed and a phase preserving processing and the TOPSAR interferometry was demonstrated [22].

- Effectiveness of the Total Zero Doppler Steering method to control the attitude of the satellite for a reduction of the Doppler offset. This method provides a minimal shift of the Doppler spectrum by the order of some Hz and thus eases the SAR processing [23].
- Suitability of the sensor for SAR oceanography, which benefits especially from the high special resolution of TerraSAR-X. New insights into measurements of wind fields, ocean waves and currents were made possible [24].
- Applicability for disaster management and crisis information: Flood mapping in Yorkshire, UK, July 3rd, 2007 and Villahermosa Mexico, November 6th, 2007, Oil Spill in Ukraine/Russia, Kerch Strait, November 2007, [25].

VI. CONCLUSION

The commissioning phase was finished right on schedule after 5.5 month and the goal was attained to ensure optimum SAR product quality and to accomplish the full operational readiness of the space and ground segment in December 2007. The TerraSAR-X team executed a very comprehensive program involving tasks such as calibration, characterization and verification of the SAR instrument and overall SAR system performance, and verification of the final image products. During the commissioning phase 12000 data takes were executed and all imaging modes were tested and verified. In several cases the obtained results even exceeded the initial specifications. Consequently TerraSAR-X turned out to be a very stable precision instrument for radar imaging.

Furthermore the potential of TerraSAR-X for repeat pass and along track interferometry and TOPSAR was shown. Novel techniques such as the Total Zero Doppler Steering proved their effectivity. The benefit from the high resolution provided by TerraSAR-X was demonstrated for geoscientific applications, oceanography and disaster monitoring.

On January 7th, 2008 the operational phase was kicked off and the image production for scientific and commercial users is running extremely satisfactory since then.
