Overview

- Motivation and Background
- Common Data Format
- Software Tools
- Integration Framework

Motivation and Background

- The predesign of new airplane configurations involves many different technical disciplines
- Goal: Find an optimal design
- Strong dependencies exist between the disciplines
 - A combination of discipline-local optima does not lead to a global optimum
 - Necessary: global optimization process
 - ➔ Look at the overall system
- Therefore: Cooperation between the individual technical disciplines is essential

Situation at DLR

- Many aerospace institutes, each one specialized on its own technical discipline
- Simulation software is institute-specific, proprietary I/O formats
- Interdisciplinary cooperation in some cross-institutional projects

But:

- Ad-hoc definition of interfaces and data formats in each project
- No common data format for all application codes
- No automated process chains
 - Applications used manually and separately from each other

Linking of Discipline-Specific Design Tools

➤ Goal

A DLR-wide system to enable the multi-disciplinary design and analysis of airplane configurations in the predesign phase.

➤ Under development at DLR in the following aeronautics projects:

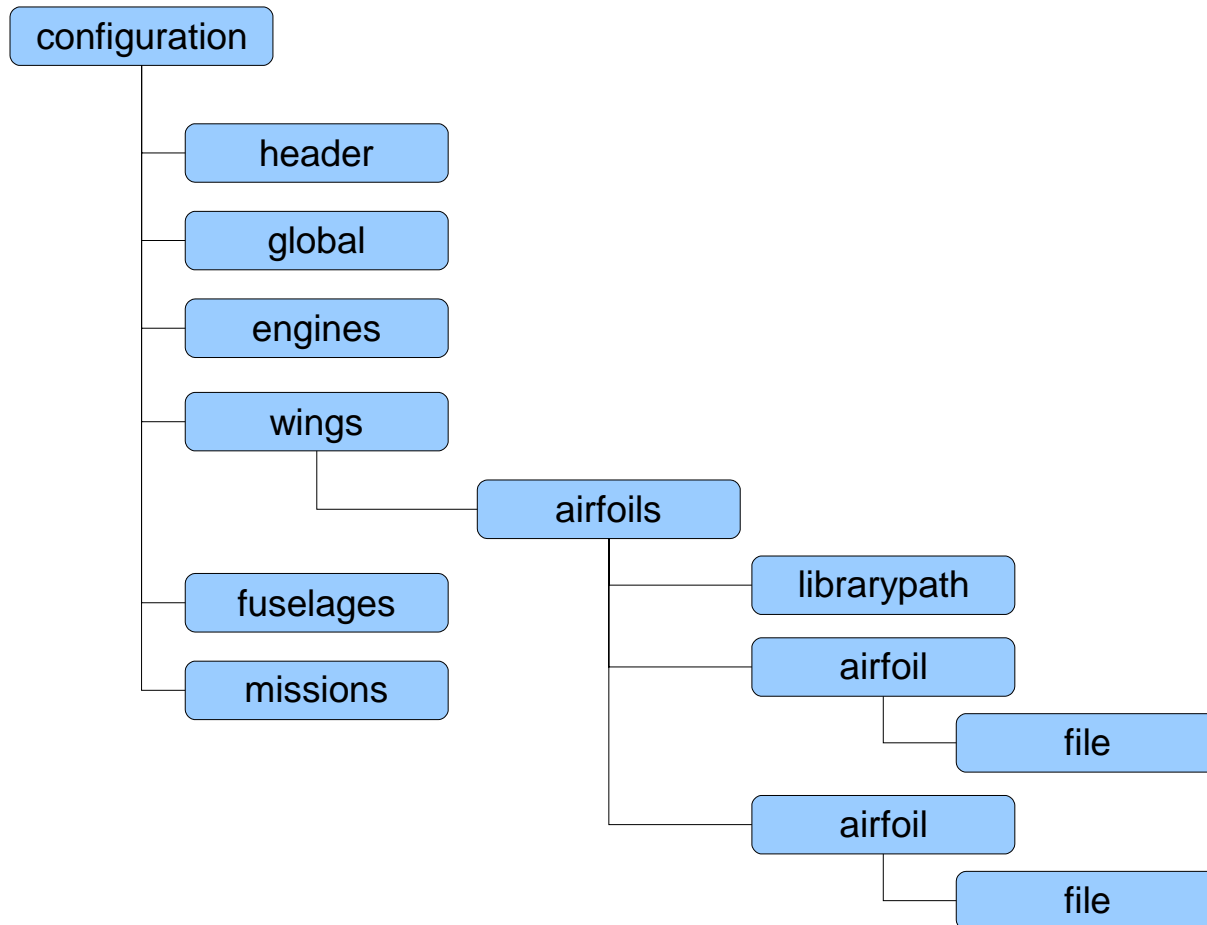

- TIVA I/II – Technology integration for the virtual aircraft
- UCAV 2010 – Unmanned combat air vehicle
- EVITA – Evaluation of innovative turbine engines

➤ Similar requirements in DLR space projects

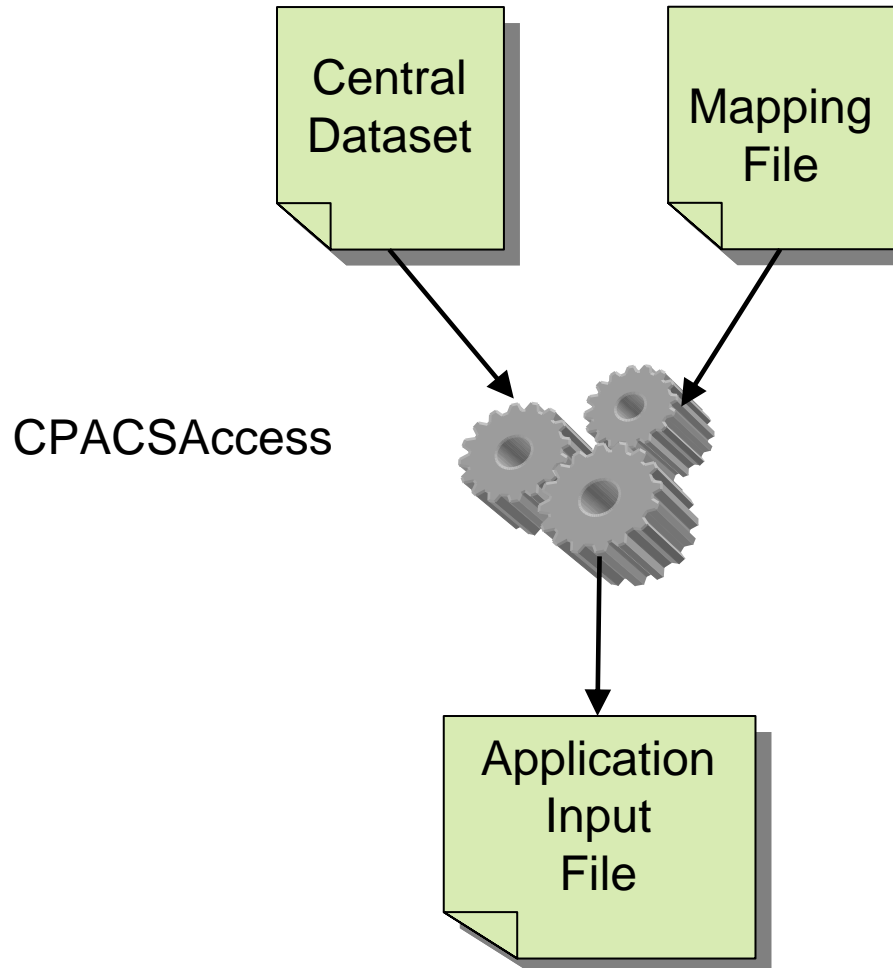

System Overview

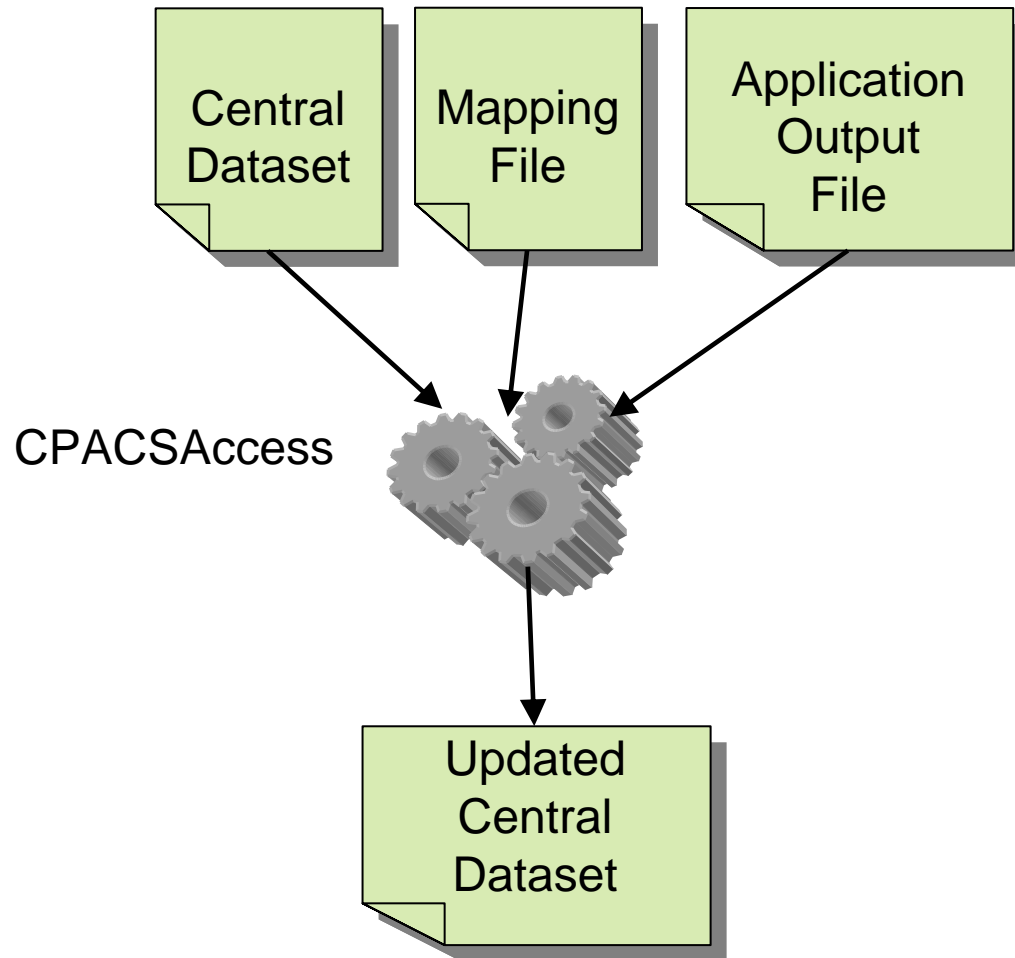

Structure of the Central Dataset

Data Export from the Central Dataset

Data Import into the Central Dataset

Example of a Mapping File

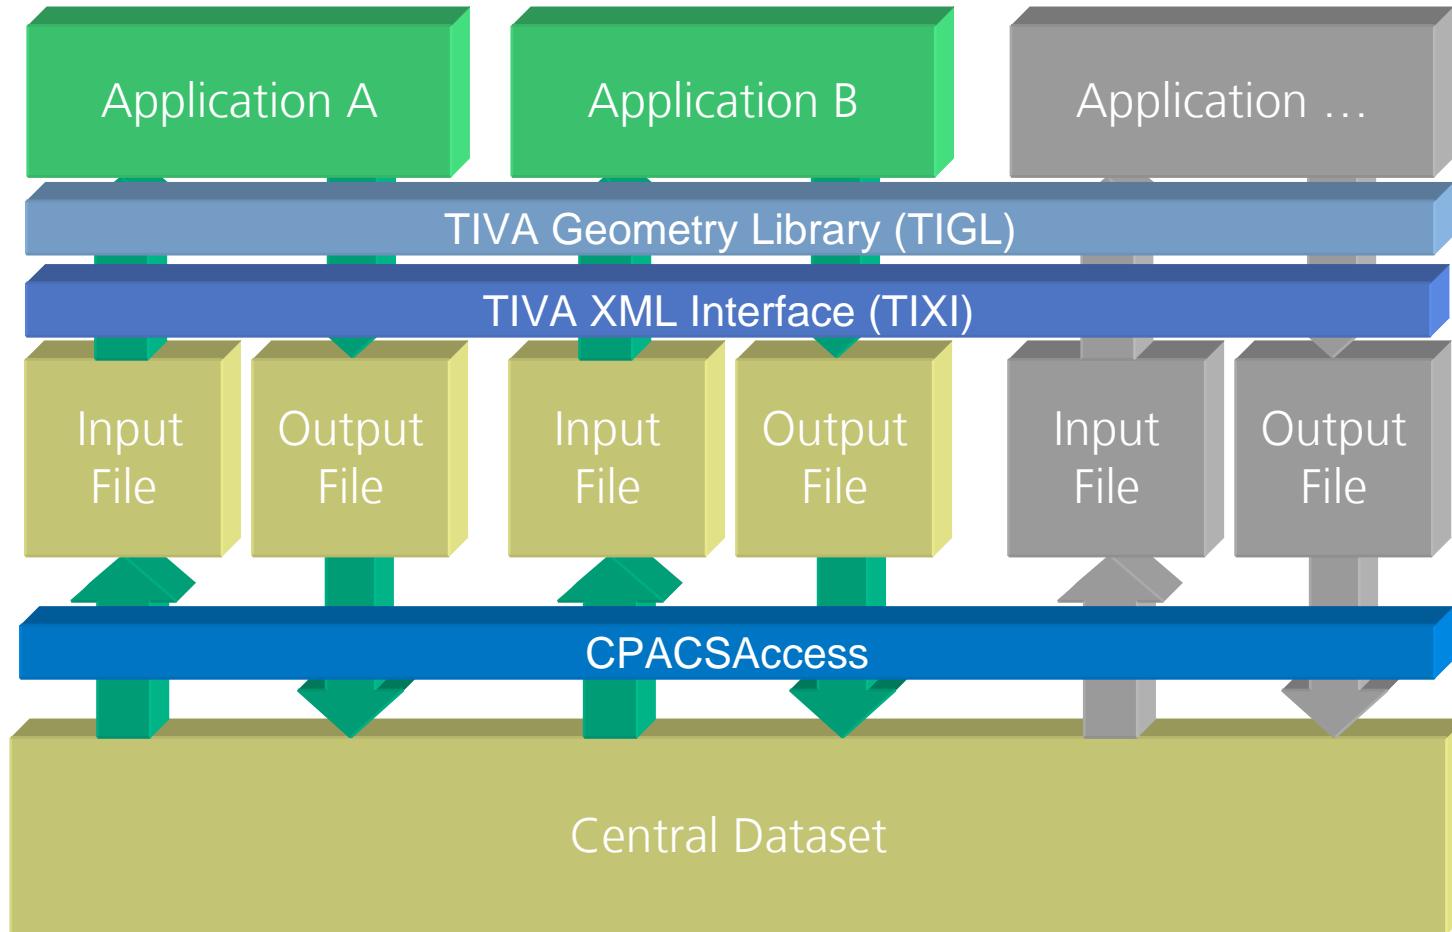

```
<?xml version="1.0" encoding="UTF-8"?>
<map:mappings xmlns:map="http://www.dlr.de/sistec/tool/mapping">

  <map:mapping>
    <map:source>/result</map:source>
    <map:target>/configuration/application[@name="IBUCK"]/result</map:target>
  </map:mapping>

  <map:mapping>
    <map:source>/result/values</map:source>
    <map:target>/configuration/common/values</map:target>
  </map:mapping>

  <map:mapping>
    <map:source>/result/old_name</map:source>
    <map:target>/configuration/common/new_name</map:target>
  </map:mapping>
  .
  .
  .
</map:mappings>
```

TIXI – TIVA XML Interface (I)

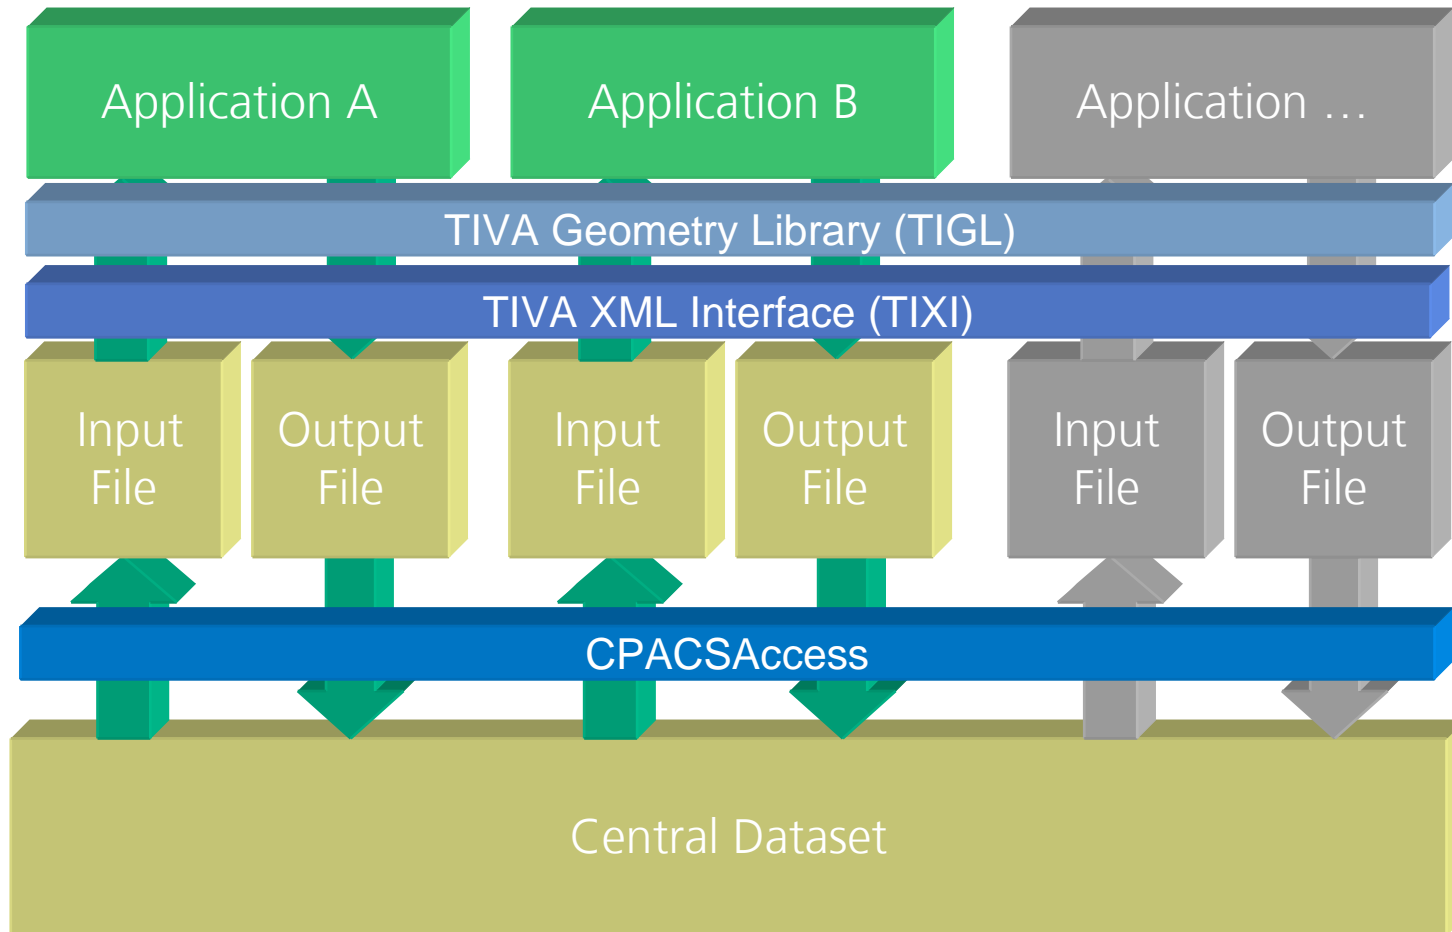

TIXI – TIVA XML Interface (II)

- Library for XML I/O
- Uses libxml2 of the Gnome project
- Provides simple access to XML content through XPath expressions
 - Functions for reading and writing of
 - Strings
 - Floating point and integer numbers
 - Matrixes
 - 3D-Points
 - Checks for existence of elements
- C, Fortran, and Python interface

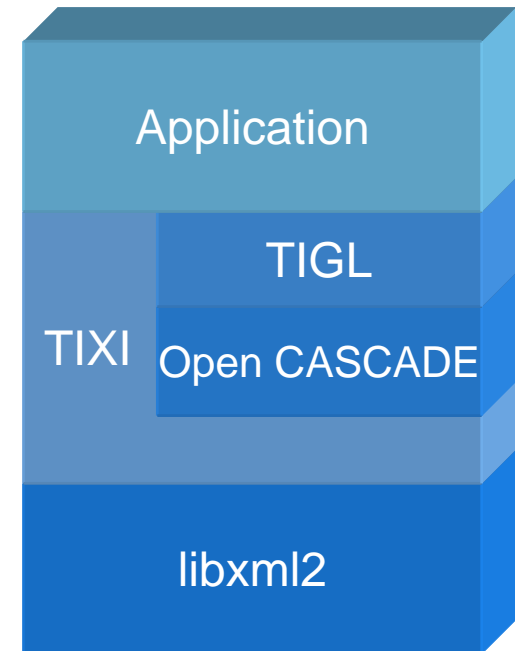

TIGL – TIVA Geometry Library (I)

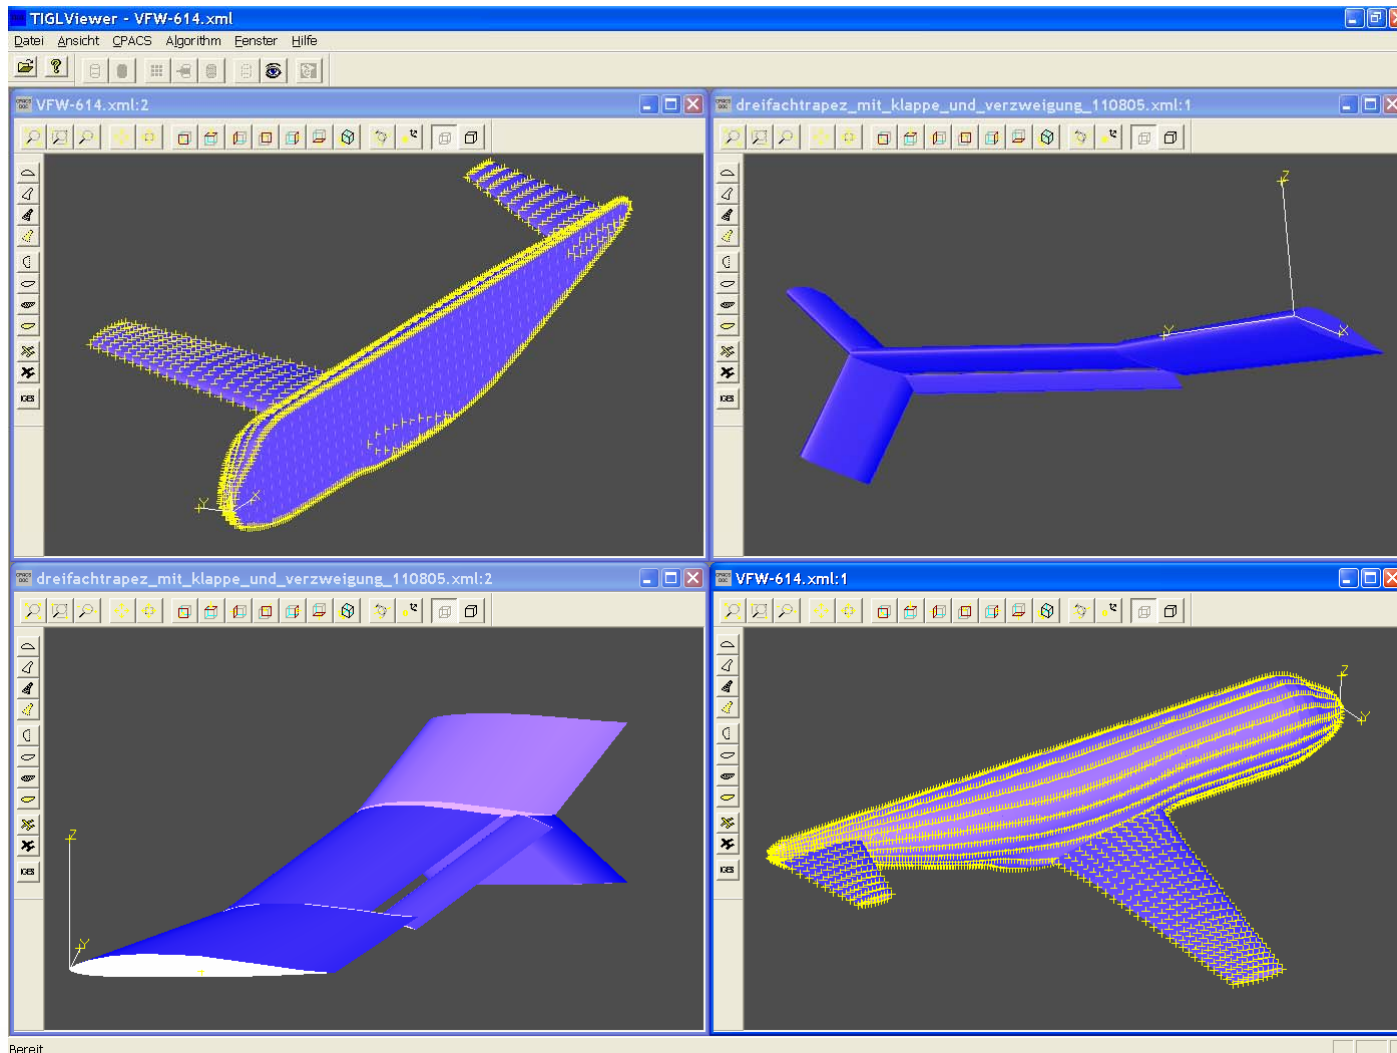

TIGL – TIVA Geometry Library (II)

- Reading and processing the geometry information stored in the central dataset
 - Currently only for fuselages and wings
 - Uses Open CASCADE
- Construction of the 3D geometry
 - Creation of surfaces from cross sections
 - Used e.g. for calculation of surface points in absolute Cartesian coordinates
- Export of the airplane geometry in IGES or STL format
- C, Fortran, and Python interface

TIGLViewer – Visualization Tool for TIGL

Framework Integration (I)

- Integration framework used: ModelCenter
- Central dataset and applications components realized as ModelCenter plugins
 - Central dataset component
 - Interface between ModelCenter and central dataset
 - Update of the central dataset
 - Export and import from and into ModelCenter
 - Application wrapper component
 - Generic component that wraps an individual (standalone) application for use in ModelCenter
 - Generation of input files, application startup and mapping of results into central dataset
 - Controller component
 - Coordinates the components of the process chain

Framework Integration (II)

The screenshot displays the Phoenix Integration ModelCenter 7.1.2 interface. The main window shows a hierarchical tree of model components on the left and a component diagram on the right. The tree includes parameters like 'dihedralangle' (4.39), 'section_1' (1), 'section_2' (2), and 'name' (VFW-614...). The diagram shows a 'Controller' component connected to 'CPACS', 'LiftingLine_with_TIGL', and 'BoxBeam_with_TIGL'.

Name	Value	Type
dihedralangle	4.39	double
section_1	1	double
section_2	2	double
positioning_2		
positioning_3		
name	VFW-614...	string
wing_2		
fuselages		
airfoils		
fuselage		
transformation		
scaling		
translation		
rotation		
sections		
segments		
positionings		
name	VFW-614 f...	string
polars		
weights		
comment	--- Referen...	string
loads	<?xml versi...	string
ConfigurationZIPFromDataStore	<view...>	file
CPACSFFromDataStore	<?xml versi...	string
CPACSToDataStore	<?xml versi...	string
LiftingLine_with_TIGL		
BoxBeam_with_TIGL		
Controller		

Summary and Outlook

- Steps to set-up a framework for collaborative engineering:
 - Define a common data format
 - Enable applications to use it
 - Integrate separate tools into a workflow system

- Future work
 - Implementation of an interface to STEP
 - Extension of the central dataset:
 - Geometry modeling for other construction units
 - Mission control data
 - Application of tools and common data format in other projects
